- [34618] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2482 (GAM2482) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [34619] GAM2482 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2482 was detected is described hereinabove with reference to Figs. 2-8.
- [34620] GAM2482 gene, herein designated GAM GENE, and GAM2482 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34621] GAM2482 gene, herein designated GAM GENE, encodes a GAM2482 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2482 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2482 precursor RNA is designated SEQ ID:2459, and is provided hereinbelow with reference to the sequence listing part.
- [34622] GAM2482 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34623] An enzyme complex designated DICER COMPLEX, dices the GAM2482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2482 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2482 RNA is designated SEQ ID:5073, and is provided hereinbelow with reference to the sequence listing part.

[34624] GAM2482 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2482 target RNA, herein designated GAM TARGET RNA. GAM2482 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34625] GAM2482 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2482 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2482 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2482 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2482 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34626] The complementary binding of GAM2482 RNA, herein designated GAM RNA, to target binding sites on GAM2482 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2482 target RNA, herein designated GAM TARGET RNA, into GAM2482 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34627] It is appreciated that GAM2482 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2482 target genes. The mRNA of each one of this plurality of GAM2482 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2482 RNA, herein designated GAM RNA, and which when bound by GAM2482 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2482 target proteins.

[34628] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2482 gene, herein designated GAM GENE, on one or more GAM2482 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34629] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2482 correlate with, and may be deduced from, the identity of the target genes which GAM2482 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34630] Nucleotide sequences of the GAM2482 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2482 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2482 are further described hereinbelow with reference to Table 1.

- [34631] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2482 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [34632] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2483 (GAM2483) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [34633] GAM2483 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2483 was detected is described hereinabove with reference to Figs. 2-8.
- [34634] GAM2483 gene, herein designated GAM GENE, and GAM2483 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34635] GAM2483 gene, herein designated GAM GENE, encodes a GAM2483 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2483 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2483 precursor RNA is designated SEQ ID:2460, and is provided hereinbelow with reference to the sequence listing part.

[34636] GAM2483 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34637] An enzyme complex designated DICER COMPLEX, dices the GAM2483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2483 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2483 RNA is designated SEQ ID:5074, and is provided hereinbelow with reference to the sequence listing part.

[34638] GAM2483 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2483 target RNA, herein designated GAM TARGET RNA. GAM2483 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34639] GAM2483 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2483 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2483 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2483 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2483 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34640] The complementary binding of GAM2483 RNA, herein designated GAM RNA, to target binding sites on GAM2483 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2483 target RNA, herein designated GAM TARGET RNA, into GAM2483 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34641] It is appreciated that GAM2483 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2483 target genes. The

mRNA of each one of this plurality of GAM2483 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2483 RNA, herein designated GAM RNA, and which when bound by GAM2483 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2483 target proteins.

[34642] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2483 gene, herein designated GAM GENE, on one or more GAM2483 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34643] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2483 correlate with, and may be deduced from, the identity of the target genes which GAM2483 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34644] Nucleotide sequences of the GAM2483 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2483 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2483 are further described hereinbelow with reference to Table 1.

[34645] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2483 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34646] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2484 (GAM2484) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34647] GAM2484 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2484 was detected is described hereinabove with reference to Figs. 2-8.

[34648] GAM2484 gene, herein designated GAM GENE, and GAM2484 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34649] GAM2484 gene, herein designated GAM GENE, encodes a GAM2484 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2484 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2484 precursor RNA is designated SEQ ID:2461, and is provided hereinbelow with reference to the sequence listing part.

[34650] GAM2484 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34651] An enzyme complex designated DICER COMPLEX, dices the GAM2484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2484 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2484 RNA is designated SEQ ID:5076, and is provided hereinbelow with reference to the sequence listing part.

[34652] GAM2484 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2484 target RNA, herein designated GAM TARGET RNA. GAM2484 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34653] GAM2484 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2484 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2484 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2484 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2484 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34654] The complementary binding of GAM2484 RNA, herein designated GAM RNA, to target binding sites on GAM2484 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2484 target RNA, herein designated GAM TARGET RNA, into GAM2484 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34655] It is appreciated that GAM2484 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2484 target genes. The mRNA of each one of this plurality of GAM2484 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2484 RNA, herein designated GAM RNA, and which when bound by GAM2484 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2484 target proteins.

[34656] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2484 gene, herein designated GAM GENE, on one or more GAM2484 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34657] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2484 correlate with, and may be deduced from, the identity of the target

genes which GAM2484 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34658] Nucleotide sequences of the GAM2484 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2484 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2484 are further described hereinbelow with reference to Table 1.

[34659] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2484 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34660] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2485 (GAM2485) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34661] GAM2485 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2485 was detected is described hereinabove with reference to Figs. 2-8.

[34662] GAM2485 gene, herein designated GAM GENE, and GAM2485 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[34663] GAM2485 gene, herein designated GAM GENE, encodes a GAM2485 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2485 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2485 precursor RNA is designated SEQ ID:2462, and is provided hereinbelow with reference to the sequence listing part.

[34664] GAM2485 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34665] An enzyme complex designated DICER COMPLEX, dices the GAM2485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2485 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2485 RNA is designated SEQ ID:5075, and is provided

hereinbelow with reference to the sequence listing part.

[34666] GAM2485 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2485 target RNA, herein designated GAM TARGET RNA. GAM2485 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34667] GAM2485 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2485 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2485 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2485 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2485 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34668] The complementary binding of GAM2485 RNA, herein designated GAM RNA, to target binding sites on GAM2485 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2485 target RNA, herein designated GAM TARGET RNA, into GAM2485 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34669] It is appreciated that GAM2485 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2485 target genes. The mRNA of each one of this plurality of GAM2485 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2485 RNA, herein designated GAM RNA, and which when bound by GAM2485 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2485 target proteins.

[34670] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2485 gene, herein designated GAM GENE, on one or more GAM2485 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G.,  
Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34671] It is yet further appreciated that specific functions, and accordingly utilities, of  
GAM2485 correlate with, and may be deduced from, the identity of the target  
genes which GAM2485 binds and inhibits, and the function of these target  
genes, as elaborated hereinbelow.

[34672] Nucleotide sequences of the GAM2485 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2485 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2485 are further described hereinbelow with reference to Table 1.

[34673] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2485 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34674] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2486 (GAM2486) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34675] GAM2486 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2486 was detected is described hereinabove with reference to Figs. 2-8.

[34676] GAM2486 gene, herein designated GAM GENE, and GAM2486 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34677] GAM2486 gene, herein designated GAM GENE, encodes a GAM2486

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2486 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2486 precursor RNA is designated SEQ ID:2463, and is provided hereinbelow with reference to the sequence listing part.

[34678] GAM2486 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34679] An enzyme complex designated DICER COMPLEX, dices the GAM2486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2486 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2486 RNA is designated SEQ ID:5077, and is provided hereinbelow with reference to the sequence listing part.

[34680] GAM2486 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM2486 target RNA, herein designated GAM TARGET RNA. GAM2486 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34681] GAM2486 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2486 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2486 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2486 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2486 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34682] The complementary binding of GAM2486 RNA, herein designated GAM RNA, to target binding sites on GAM2486 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of GAM2486 target RNA, herein designated GAM TARGET RNA, into GAM2486 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34683] It is appreciated that GAM2486 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2486 target genes. The mRNA of each one of this plurality of GAM2486 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2486 RNA, herein designated GAM RNA, and which when bound by GAM2486 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2486 target proteins.

[34684] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2486 gene, herein designated GAM GENE, on one or more GAM2486 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34685] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2486 correlate with, and may be deduced from, the identity of the target genes which GAM2486 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34686] Nucleotide sequences of the GAM2486 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2486 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2486 are further described hereinbelow with reference to Table 1.

[34687] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2486 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34688] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2487 (GAM2487) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34689] GAM2487 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2487 was detected is described hereinabove with reference to Figs. 2-8.

[34690] GAM2487 gene, herein designated GAM GENE, and GAM2487 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34691] GAM2487 gene, herein designated GAM GENE, encodes a GAM2487 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2487 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2487 precursor RNA is designated SEQ ID:2464, and is provided hereinbelow with reference to the sequence listing part.

[34692] GAM2487 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34693] An enzyme complex designated DICER COMPLEX, dices the GAM2487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2487 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2487 RNA is designated SEQ ID:5079, and is provided hereinbelow with reference to the sequence listing part.

[34694] GAM2487 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2487 target RNA, herein designated GAM TARGET RNA. GAM2487 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34695] GAM2487 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2487 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2487 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2487 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2487 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[34696] The complementary binding of GAM2487 RNA, herein designated GAM RNA, to target binding sites on GAM2487 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2487 target RNA, herein designated GAM TARGET RNA, into GAM2487 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34697] It is appreciated that GAM2487 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2487 target genes. The mRNA of each one of this plurality of GAM2487 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2487 RNA, herein designated GAM RNA, and which when bound by GAM2487 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2487 target proteins.

[34698] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2487 gene, herein designated GAM GENE, on one or more GAM2487 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34699] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2487 correlate with, and may be deduced from, the identity of the target genes which GAM2487 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34700] Nucleotide sequences of the GAM2487 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2487 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2487 are further described hereinbelow with reference to Table 1.

[34701] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2487 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34702] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2488 (GAM2488) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [34703] GAM2488 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2488 was detected is described hereinabove with reference to Figs. 2-8.
- [34704] GAM2488 gene, herein designated GAM GENE, and GAM2488 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34705] GAM2488 gene, herein designated GAM GENE, encodes a GAM2488 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2488 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2488 precursor RNA is designated SEQ ID:2465, and is provided hereinbelow with reference to the sequence listing part.
- [34706] GAM2488 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [34707] An enzyme complex designated DICER COMPLEX, dices the GAM2488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2488 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2488 RNA is designated SEQ ID:5078, and is provided hereinbelow with reference to the sequence listing part.

[34708] GAM2488 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2488 target RNA, herein designated GAM TARGET RNA. GAM2488 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34709] GAM2488 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2488 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2488 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2488 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2488 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34710] The complementary binding of GAM2488 RNA, herein designated GAM RNA, to target binding sites on GAM2488 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2488 target RNA, herein designated GAM TARGET RNA, into GAM2488 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34711] It is appreciated that GAM2488 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2488 target genes. The mRNA of each one of this plurality of GAM2488 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2488 RNA, herein designated GAM RNA, and which when bound by GAM2488 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2488 target proteins.

[34712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2488 gene, herein designated GAM GENE, on one or more GAM2488 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34713] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2488 correlate with, and may be deduced from, the identity of the target genes which GAM2488 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34714] Nucleotide sequences of the GAM2488 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2488 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2488 are further described hereinbelow with reference to Table 1.

[34715] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2488 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34716] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 2489 (GAM2489) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [34717] GAM2489 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2489 was detected is described hereinabove with reference to Figs. 2-8.
- [34718] GAM2489 gene, herein designated GAM GENE, and GAM2489 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34719] GAM2489 gene, herein designated GAM GENE, encodes a GAM2489 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2489 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2489 precursor RNA is designated SEQ ID:2466, and is provided hereinbelow with reference to the sequence listing part.
- [34720] GAM2489 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34721] An enzyme complex designated DICER COMPLEX, dices the GAM2489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2489 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2489 RNA is designated SEQ ID:5080, and is provided hereinbelow with reference to the sequence listing part.
- [34722] GAM2489 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2489 target RNA, herein designated GAM TARGET RNA. GAM2489 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34723] GAM2489 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2489 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2489 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2489 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2489 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34724] The complementary binding of GAM2489 RNA, herein designated GAM RNA, to target binding sites on GAM2489 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2489 target RNA, herein designated GAM TARGET RNA, into GAM2489 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34725] It is appreciated that GAM2489 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2489 target genes. The mRNA of each one of this plurality of GAM2489 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2489 RNA, herein designated GAM RNA, and which when bound by GAM2489 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2489 target proteins.

[34726] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2489 gene, herein designated GAM GENE, on one or more GAM2489 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34727] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2489 correlate with, and may be deduced from, the identity of the target genes which GAM2489 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34728] Nucleotide sequences of the GAM2489 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2489 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2489 are further described hereinbelow with reference to Table 1.

[34729] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2489 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[34730] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2490 (GAM2490) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34731] GAM2490 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2490 was detected is described hereinabove with reference to Figs. 2-8.

[34732] GAM2490 gene, herein designated GAM GENE, and GAM2490 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34733] GAM2490 gene, herein designated GAM GENE, encodes a GAM2490 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2490 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2490 precursor RNA is designated SEQ ID:2467, and is provided hereinbelow with reference to the sequence listing part.

[34734] GAM2490 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34735] An enzyme complex designated DICER COMPLEX, dices the GAM2490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2490 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2490 RNA is designated SEQ ID:5081, and is provided hereinbelow with reference to the sequence listing part.

[34736] GAM2490 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2490 target RNA, herein designated GAM TARGET RNA. GAM2490 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34737] GAM2490 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2490 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2490 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2490 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2490 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34738] The complementary binding of GAM2490 RNA, herein designated GAM RNA, to target binding sites on GAM2490 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2490 target RNA, herein designated GAM TARGET RNA, into GAM2490 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34739] It is appreciated that GAM2490 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2490 target genes. The mRNA of each one of this plurality of GAM2490 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2490 RNA, herein designated GAM RNA, and which when bound by GAM2490 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2490 target proteins.

[34740] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2490 gene, herein designated GAM GENE, on one or more GAM2490 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34741] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2490 correlate with, and may be deduced from, the identity of the target genes which GAM2490 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34742] Nucleotide sequences of the GAM2490 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2490 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2490 are further described hereinbelow with reference to Table 1.

[34743] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2490 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34744] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2491 (GAM2491) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34745] GAM2491 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2491 was detected is described hereinabove with reference to Figs. 2-8.

[34746] GAM2491 gene, herein designated GAM GENE, and GAM2491 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34747] GAM2491 gene, herein designated GAM GENE, encodes a GAM2491 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2491 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2491 precursor RNA is designated SEQ ID:2468, and is provided hereinbelow with reference to the sequence listing part.

[34748] GAM2491 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34749] An enzyme complex designated DICER COMPLEX, dices the GAM2491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2491 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2491 RNA is designated SEQ ID:5082, and is provided hereinbelow with reference to the sequence listing part.

[34750] GAM2491 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2491 target RNA, herein designated GAM TARGET RNA. GAM2491 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34751] GAM2491 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2491 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2491 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2491 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2491 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34752] The complementary binding of GAM2491 RNA, herein designated GAM RNA, to target binding sites on GAM2491 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2491 target RNA, herein designated GAM TARGET RNA, into GAM2491 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34753] It is appreciated that GAM2491 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2491 target genes. The

mRNA of each one of this plurality of GAM2491 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2491 RNA, herein designated GAM RNA, and which when bound by GAM2491 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2491 target proteins.

[34754] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2491 gene, herein designated GAM GENE, on one or more GAM2491 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34755] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2491 correlate with, and may be deduced from, the identity of the target genes which GAM2491 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34756] Nucleotide sequences of the GAM2491 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2491 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2491 are further described hereinbelow with reference to Table 1.

[34757] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2491 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34758] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2492 (GAM2492) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34759] GAM2492 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2492 was detected is described hereinabove with reference to Figs. 2-8.

[34760] GAM2492 gene, herein designated GAM GENE, and GAM2492 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34761] GAM2492 gene, herein designated GAM GENE, encodes a GAM2492 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2492 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2492 precursor RNA is designated SEQ ID:2469, and is provided hereinbelow with reference to the sequence listing part.

[34762] GAM2492 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34763] An enzyme complex designated DICER COMPLEX, dices the GAM2492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2492 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2492 RNA is designated SEQ ID:5083, and is provided hereinbelow with reference to the sequence listing part.

[34764] GAM2492 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2492 target RNA, herein designated GAM TARGET RNA. GAM2492 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34765] GAM2492 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2492 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2492 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2492 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2492 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34766] The complementary binding of GAM2492 RNA, herein designated GAM RNA, to target binding sites on GAM2492 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2492 target RNA, herein designated GAM TARGET RNA, into GAM2492 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34767] It is appreciated that GAM2492 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2492 target genes. The mRNA of each one of this plurality of GAM2492 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2492 RNA, herein designated GAM RNA, and which when bound by GAM2492 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2492 target proteins.

[34768] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2492 gene, herein designated GAM GENE, on one or more GAM2492 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34769] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2492 correlate with, and may be deduced from, the identity of the target

genes which GAM2492 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34770] Nucleotide sequences of the GAM2492 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2492 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2492 are further described hereinbelow with reference to Table 1.

[34771] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2492 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34772] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2493 (GAM2493) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34773] GAM2493 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2493 was detected is described hereinabove with reference to Figs. 2-8.

[34774] GAM2493 gene, herein designated GAM GENE, and GAM2493 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[34775] GAM2493 gene, herein designated GAM GENE, encodes a GAM2493 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2493 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2493 precursor RNA is designated SEQ ID:2470, and is provided hereinbelow with reference to the sequence listing part.

[34776] GAM2493 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34777] An enzyme complex designated DICER COMPLEX, dices the GAM2493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2493 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2493 RNA is designated SEQ ID:5084, and is provided

hereinbelow with reference to the sequence listing part.

[34778] GAM2493 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2493 target RNA, herein designated GAM TARGET RNA. GAM2493 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34779] GAM2493 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2493 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2493 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2493 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2493 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34780] The complementary binding of GAM2493 RNA, herein designated GAM RNA, to target binding sites on GAM2493 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2493 target RNA, herein designated GAM TARGET RNA, into GAM2493 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34781] It is appreciated that GAM2493 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2493 target genes. The mRNA of each one of this plurality of GAM2493 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2493 RNA, herein designated GAM RNA, and which when bound by GAM2493 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2493 target proteins.

[34782] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2493 gene, herein designated GAM GENE, on one or more GAM2493 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34783] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2493 correlate with, and may be deduced from, the identity of the target genes which GAM2493 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34784] Nucleotide sequences of the GAM2493 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2493 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2493 are further described hereinbelow with reference to Table 1.

[34785] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2493 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34786] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2494 (GAM2494) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34787] GAM2494 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2494 was detected is described hereinabove with reference to Figs. 2-8.

[34788] GAM2494 gene, herein designated GAM GENE, and GAM2494 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34789] GAM2494 gene, herein designated GAM GENE, encodes a GAM2494 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2494 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2494 precursor RNA is designated SEQ ID:2471, and is provided hereinbelow with reference to the sequence listing part.

[34790] GAM2494 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34791] An enzyme complex designated DICER COMPLEX, dices the GAM2494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2494 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2494 RNA is designated SEQ ID:5085, and is provided hereinbelow with reference to the sequence listing part.

[34792] GAM2494 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2494 target RNA, herein designated GAM TARGET RNA. GAM2494 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34793] GAM2494 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2494 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2494 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2494 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2494 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34794] The complementary binding of GAM2494 RNA, herein designated GAM RNA, to target binding sites on GAM2494 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2494 target RNA, herein designated GAM TARGET RNA, into GAM2494 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34795] It is appreciated that GAM2494 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2494 target genes. The mRNA of each one of this plurality of GAM2494 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2494 RNA, herein designated GAM RNA, and which when bound by GAM2494 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2494 target proteins.

[34796] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2494 gene, herein designated GAM GENE, on one or more GAM2494 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34797] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2494 correlate with, and may be deduced from, the identity of the target genes which GAM2494 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34798] Nucleotide sequences of the GAM2494 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2494 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2494 are further described hereinbelow with reference to Table 1.

[34799] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2494 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34800] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2495 (GAM2495) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34801] GAM2495 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2495 was detected is described hereinabove with reference to Figs. 2-8.

[34802] GAM2495 gene, herein designated GAM GENE, and GAM2495 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34803] GAM2495 gene, herein designated GAM GENE, encodes a GAM2495 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2495 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2495 precursor RNA is designated SEQ ID:2472, and is provided hereinbelow with reference to the sequence listing part.

[34804] GAM2495 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34805] An enzyme complex designated DICER COMPLEX, dices the GAM2495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2495 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2495 RNA is designated SEQ ID:5086, and is provided hereinbelow with reference to the sequence listing part.
- [34806] GAM2495 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2495 target RNA, herein designated GAM TARGET RNA. GAM2495 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34807] GAM2495 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2495 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2495 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2495 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2495 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34808] The complementary binding of GAM2495 RNA, herein designated GAM RNA, to target binding sites on GAM2495 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2495 target RNA, herein designated GAM TARGET RNA, into GAM2495 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34809] It is appreciated that GAM2495 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2495 target genes. The mRNA of each one of this plurality of GAM2495 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2495 RNA, herein designated GAM RNA, and which when bound by GAM2495 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2495 target proteins.

[34810] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2495 gene, herein designated GAM GENE, on one or more GAM2495 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34811] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2495 correlate with, and may be deduced from, the identity of the target genes which GAM2495 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34812] Nucleotide sequences of the GAM2495 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2495 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2495 are further described hereinbelow with reference to Table 1.

[34813] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2495 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [34814] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2496 (GAM2496) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [34815] GAM2496 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2496 was detected is described hereinabove with reference to Figs. 2-8.
- [34816] GAM2496 gene, herein designated GAM GENE, and GAM2496 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34817] GAM2496 gene, herein designated GAM GENE, encodes a GAM2496 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2496 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2496 precursor RNA is designated SEQ ID:2473, and is provided hereinbelow with reference to the sequence listing part.
- [34818] GAM2496 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34819] An enzyme complex designated DICER COMPLEX, dices the GAM2496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2496 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2496 RNA is designated SEQ ID:5087, and is provided hereinbelow with reference to the sequence listing part.

[34820] GAM2496 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2496 target RNA, herein designated GAM TARGET RNA. GAM2496 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34821] GAM2496 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2496 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2496 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2496 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2496 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34822] The complementary binding of GAM2496 RNA, herein designated GAM RNA, to target binding sites on GAM2496 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2496 target RNA, herein designated GAM TARGET RNA, into GAM2496 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34823] It is appreciated that GAM2496 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2496 target genes. The mRNA of each one of this plurality of GAM2496 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2496 RNA, herein designated GAM RNA, and which when bound by GAM2496 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2496 target proteins.

[34824] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2496 gene, herein designated GAM GENE, on one or more GAM2496 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34825] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2496 correlate with, and may be deduced from, the identity of the target genes which GAM2496 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34826] Nucleotide sequences of the GAM2496 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2496 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2496 are further described hereinbelow with reference to Table 1.

[34827] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2496 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34828] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2497 (GAM2497) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34829] GAM2497 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2497 was detected is described hereinabove with reference to Figs. 2-8.

[34830] GAM2497 gene, herein designated GAM GENE, and GAM2497 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34831] GAM2497 gene, herein designated GAM GENE, encodes a GAM2497 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2497 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2497 precursor RNA is designated SEQ ID:2474, and is provided hereinbelow with reference to the sequence listing part.

[34832] GAM2497 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34833] An enzyme complex designated DICER COMPLEX, dices the GAM2497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2497 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2497 RNA is designated SEQ ID:5088, and is provided hereinbelow with reference to the sequence listing part.

[34834] GAM2497 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2497 target RNA, herein designated GAM TARGET RNA. GAM2497 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34835] GAM2497 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2497 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2497 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2497 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2497 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34836] The complementary binding of GAM2497 RNA, herein designated GAM RNA, to target binding sites on GAM2497 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2497 target RNA, herein designated GAM TARGET RNA, into GAM2497 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34837] It is appreciated that GAM2497 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2497 target genes. The

mRNA of each one of this plurality of GAM2497 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2497 RNA, herein designated GAM RNA, and which when bound by GAM2497 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2497 target proteins.

[34838] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2497 gene, herein designated GAM GENE, on one or more GAM2497 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34839] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2497 correlate with, and may be deduced from, the identity of the target genes which GAM2497 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34840] Nucleotide sequences of the GAM2497 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2497 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2497 are further described hereinbelow with reference to Table 1.

[34841] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2497 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34842] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2498 (GAM2498) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34843] GAM2498 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2498 was detected is described hereinabove with reference to Figs. 2-8.

[34844] GAM2498 gene, herein designated GAM GENE, and GAM2498 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34845] GAM2498 gene, herein designated GAM GENE, encodes a GAM2498 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2498 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2498 precursor RNA is designated SEQ ID:2475, and is provided hereinbelow with reference to the sequence listing part.

[34846] GAM2498 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34847] An enzyme complex designated DICER COMPLEX, dices the GAM2498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2498 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2498 RNA is designated SEQ ID:5089, and is provided hereinbelow with reference to the sequence listing part.

[34848] GAM2498 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2498 target RNA, herein designated GAM TARGET RNA. GAM2498 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34849] GAM2498 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2498 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2498 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2498 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2498 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34850] The complementary binding of GAM2498 RNA, herein designated GAM RNA, to target binding sites on GAM2498 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2498 target RNA, herein designated GAM TARGET RNA, into GAM2498 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34851] It is appreciated that GAM2498 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2498 target genes. The mRNA of each one of this plurality of GAM2498 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2498 RNA, herein designated GAM RNA, and which when bound by GAM2498 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2498 target proteins.

[34852] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2498 gene, herein designated GAM GENE, on one or more GAM2498 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34853] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2498 correlate with, and may be deduced from, the identity of the target

genes which GAM2498 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34854] Nucleotide sequences of the GAM2498 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2498 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2498 are further described hereinbelow with reference to Table 1.

[34855] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2498 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34856] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2499 (GAM2499) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34857] GAM2499 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2499 was detected is described hereinabove with reference to Figs. 2-8.

[34858] GAM2499 gene, herein designated GAM GENE, and GAM2499 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[34859] GAM2499 gene, herein designated GAM GENE, encodes a GAM2499 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2499 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2499 precursor RNA is designated SEQ ID:2476, and is provided hereinbelow with reference to the sequence listing part.

[34860] GAM2499 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34861] An enzyme complex designated DICER COMPLEX, dices the GAM2499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2499 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2499 RNA is designated SEQ ID:5090, and is provided

hereinbelow with reference to the sequence listing part.

[34862] GAM2499 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2499 target RNA, herein designated GAM TARGET RNA. GAM2499 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34863] GAM2499 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2499 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2499 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2499 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2499 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34864] The complementary binding of GAM2499 RNA, herein designated GAM RNA, to target binding sites on GAM2499 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2499 target RNA, herein designated GAM TARGET RNA, into GAM2499 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34865] It is appreciated that GAM2499 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2499 target genes. The mRNA of each one of this plurality of GAM2499 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2499 RNA, herein designated GAM RNA, and which when bound by GAM2499 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2499 target proteins.

[34866] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2499 gene, herein designated GAM GENE, on one or more GAM2499 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34867] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2499 correlate with, and may be deduced from, the identity of the target genes which GAM2499 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34868] Nucleotide sequences of the GAM2499 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2499 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2499 are further described hereinbelow with reference to Table 1.

[34869] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2499 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34870] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2500 (GAM2500) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34871] GAM2500 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2500 was detected is described hereinabove with reference to Figs. 2-8.

[34872] GAM2500 gene, herein designated GAM GENE, and GAM2500 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34873] GAM2500 gene, herein designated GAM GENE, encodes a GAM2500 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2500 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2500 precursor RNA is designated SEQ ID:2477, and is provided hereinbelow with reference to the sequence listing part.

[34874] GAM2500 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34875] An enzyme complex designated DICER COMPLEX, dices the GAM2500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2500 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2500 RNA is designated SEQ ID:5091, and is provided hereinbelow with reference to the sequence listing part.

[34876] GAM2500 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2500 target RNA, herein designated GAM TARGET RNA. GAM2500 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34877] GAM2500 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2500 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2500 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2500 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2500 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34878] The complementary binding of GAM2500 RNA, herein designated GAM RNA, to target binding sites on GAM2500 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2500 target RNA, herein designated GAM TARGET RNA, into GAM2500 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34879] It is appreciated that GAM2500 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2500 target genes. The mRNA of each one of this plurality of GAM2500 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2500 RNA, herein designated GAM RNA, and which when bound by GAM2500 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2500 target proteins.

[34880] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2500 gene, herein designated GAM GENE, on one or more GAM2500 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34881] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2500 correlate with, and may be deduced from, the identity of the target genes which GAM2500 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34882] Nucleotide sequences of the GAM2500 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2500 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2500 are further described hereinbelow with reference to Table 1.

[34883] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2500 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34884] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2501 (GAM2501) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [34885] GAM2501 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2501 was detected is described hereinabove with reference to Figs. 2-8.
- [34886] GAM2501 gene, herein designated GAM GENE, and GAM2501 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34887] GAM2501 gene, herein designated GAM GENE, encodes a GAM2501 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2501 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2501 precursor RNA is designated SEQ ID:2478, and is provided hereinbelow with reference to the sequence listing part.
- [34888] GAM2501 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34889] An enzyme complex designated DICER COMPLEX, dices the GAM2501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2501 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2501 RNA is designated SEQ ID:5092, and is provided hereinbelow with reference to the sequence listing part.
- [34890] GAM2501 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2501 target RNA, herein designated GAM TARGET RNA. GAM2501 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34891] GAM2501 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2501 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2501 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2501 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2501 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34892] The complementary binding of GAM2501 RNA, herein designated GAM RNA, to target binding sites on GAM2501 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2501 target RNA, herein designated GAM TARGET RNA, into GAM2501 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34893] It is appreciated that GAM2501 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2501 target genes. The mRNA of each one of this plurality of GAM2501 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2501 RNA, herein designated GAM RNA, and which when bound by GAM2501 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2501 target proteins.

[34894] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2501 gene, herein designated GAM GENE, on one or more GAM2501 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34895] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2501 correlate with, and may be deduced from, the identity of the target genes which GAM2501 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34896] Nucleotide sequences of the GAM2501 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2501 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2501 are further described hereinbelow with reference to Table 1.

[34897] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2501 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[34898] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2502 (GAM2502) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34899] GAM2502 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2502 was detected is described hereinabove with reference to Figs. 2-8.

[34900] GAM2502 gene, herein designated GAM GENE, and GAM2502 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34901] GAM2502 gene, herein designated GAM GENE, encodes a GAM2502 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2502 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2502 precursor RNA is designated SEQ ID:2479, and is provided hereinbelow with reference to the sequence listing part.

[34902] GAM2502 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34903] An enzyme complex designated DICER COMPLEX, dices the GAM2502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2502 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2502 RNA is designated SEQ ID:5093, and is provided hereinbelow with reference to the sequence listing part.

[34904] GAM2502 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2502 target RNA, herein designated GAM TARGET RNA. GAM2502 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34905] GAM2502 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2502 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2502 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2502 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2502 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34906] The complementary binding of GAM2502 RNA, herein designated GAM RNA, to target binding sites on GAM2502 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2502 target RNA, herein designated GAM TARGET RNA, into GAM2502 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34907] It is appreciated that GAM2502 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2502 target genes. The mRNA of each one of this plurality of GAM2502 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2502 RNA, herein designated GAM RNA, and which when bound by GAM2502 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2502 target proteins.

[34908] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2502 gene, herein designated GAM GENE, on one or more GAM2502 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34909] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2502 correlate with, and may be deduced from, the identity of the target genes which GAM2502 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34910] Nucleotide sequences of the GAM2502 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2502 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2502 are further described hereinbelow with reference to Table 1.

- [34911] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2502 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [34912] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2503 (GAM2503) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [34913] GAM2503 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2503 was detected is described hereinabove with reference to Figs. 2-8.
- [34914] GAM2503 gene, herein designated GAM GENE, and GAM2503 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [34915] GAM2503 gene, herein designated GAM GENE, encodes a GAM2503 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2503 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2503 precursor RNA is designated SEQ ID:2480, and is provided hereinbelow with reference to the sequence listing part.

[34916] GAM2503 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34917] An enzyme complex designated DICER COMPLEX, dices the GAM2503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2503 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2503 RNA is designated SEQ ID:5094, and is provided hereinbelow with reference to the sequence listing part.

[34918] GAM2503 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2503 target RNA, herein designated GAM TARGET RNA. GAM2503 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34919] GAM2503 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2503 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2503 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2503 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2503 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34920] The complementary binding of GAM2503 RNA, herein designated GAM RNA, to target binding sites on GAM2503 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2503 target RNA, herein designated GAM TARGET RNA, into GAM2503 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34921] It is appreciated that GAM2503 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2503 target genes. The

mRNA of each one of this plurality of GAM2503 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2503 RNA, herein designated GAM RNA, and which when bound by GAM2503 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2503 target proteins.

[34922] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2503 gene, herein designated GAM GENE, on one or more GAM2503 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34923] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2503 correlate with, and may be deduced from, the identity of the target genes which GAM2503 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34924] Nucleotide sequences of the GAM2503 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2503 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2503 are further described hereinbelow with reference to Table 1.

[34925] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2503 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34926] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2504 (GAM2504) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34927] GAM2504 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2504 was detected is described hereinabove with reference to Figs. 2-8.

[34928] GAM2504 gene, herein designated GAM GENE, and GAM2504 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34929] GAM2504 gene, herein designated GAM GENE, encodes a GAM2504 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2504 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2504 precursor RNA is designated SEQ ID:2481, and is provided hereinbelow with reference to the sequence listing part.

[34930] GAM2504 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34931] An enzyme complex designated DICER COMPLEX, dices the GAM2504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2504 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2504 RNA is designated SEQ ID:5095, and is provided hereinbelow with reference to the sequence listing part.

[34932] GAM2504 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2504 target RNA, herein designated GAM TARGET RNA. GAM2504 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34933] GAM2504 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2504 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2504 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2504 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2504 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34934] The complementary binding of GAM2504 RNA, herein designated GAM RNA, to target binding sites on GAM2504 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2504 target RNA, herein designated GAM TARGET RNA, into GAM2504 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34935] It is appreciated that GAM2504 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2504 target genes. The mRNA of each one of this plurality of GAM2504 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2504 RNA, herein designated GAM RNA, and which when bound by GAM2504 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2504 target proteins.

[34936] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2504 gene, herein designated GAM GENE, on one or more GAM2504 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34937] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2504 correlate with, and may be deduced from, the identity of the target

genes which GAM2504 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34938] Nucleotide sequences of the GAM2504 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2504 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2504 are further described hereinbelow with reference to Table 1.

[34939] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2504 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34940] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2505 (GAM2505) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34941] GAM2505 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2505 was detected is described hereinabove with reference to Figs. 2-8.

[34942] GAM2505 gene, herein designated GAM GENE, and GAM2505 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[34943] GAM2505 gene, herein designated GAM GENE, encodes a GAM2505 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2505 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2505 precursor RNA is designated SEQ ID:2482, and is provided hereinbelow with reference to the sequence listing part.

[34944] GAM2505 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34945] An enzyme complex designated DICER COMPLEX, dices the GAM2505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2505 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2505 RNA is designated SEQ ID:5096, and is provided

hereinbelow with reference to the sequence listing part.

[34946] GAM2505 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2505 target RNA, herein designated GAM TARGET RNA. GAM2505 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34947] GAM2505 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2505 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2505 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2505 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2505 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34948] The complementary binding of GAM2505 RNA, herein designated GAM RNA, to target binding sites on GAM2505 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2505 target RNA, herein designated GAM TARGET RNA, into GAM2505 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34949] It is appreciated that GAM2505 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2505 target genes. The mRNA of each one of this plurality of GAM2505 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2505 RNA, herein designated GAM RNA, and which when bound by GAM2505 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2505 target proteins.

[34950] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2505 gene, herein designated GAM GENE, on one or more GAM2505 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34951] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2505 correlate with, and may be deduced from, the identity of the target genes which GAM2505 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34952] Nucleotide sequences of the GAM2505 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2505 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2505 are further described hereinbelow with reference to Table 1.

[34953] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2505 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34954] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2506 (GAM2506) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34955] GAM2506 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2506 was detected is described hereinabove with reference to Figs. 2-8.

[34956] GAM2506 gene, herein designated GAM GENE, and GAM2506 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34957] GAM2506 gene, herein designated GAM GENE, encodes a GAM2506 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2506 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2506 precursor RNA is designated SEQ ID:2483, and is provided hereinbelow with reference to the sequence listing part.

[34958] GAM2506 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34959] An enzyme complex designated DICER COMPLEX, dices the GAM2506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2506 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2506 RNA is designated SEQ ID:5097, and is provided hereinbelow with reference to the sequence listing part.

[34960] GAM2506 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2506 target RNA, herein designated GAM TARGET RNA. GAM2506 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34961] GAM2506 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2506 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2506 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2506 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2506 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34962] The complementary binding of GAM2506 RNA, herein designated GAM RNA, to target binding sites on GAM2506 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2506 target RNA, herein designated GAM TARGET RNA, into GAM2506 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34963] It is appreciated that GAM2506 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2506 target genes. The mRNA of each one of this plurality of GAM2506 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2506 RNA, herein designated GAM RNA, and which when bound by GAM2506 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2506 target proteins.

[34964] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2506 gene, herein designated GAM GENE, on one or more GAM2506 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34965] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2506 correlate with, and may be deduced from, the identity of the target genes which GAM2506 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34966] Nucleotide sequences of the GAM2506 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2506 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2506 are further described hereinbelow with reference to Table 1.

[34967] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2506 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34968] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2507 (GAM2507) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34969] GAM2507 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2507 was detected is described hereinabove with reference to Figs. 2-8.

[34970] GAM2507 gene, herein designated GAM GENE, and GAM2507 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34971] GAM2507 gene, herein designated GAM GENE, encodes a GAM2507 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2507 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2507 precursor RNA is designated SEQ ID:2484, and is provided hereinbelow with reference to the sequence listing part.

[34972] GAM2507 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [34973] An enzyme complex designated DICER COMPLEX, dices the GAM2507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2507 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2507 RNA is designated SEQ ID:5098, and is provided hereinbelow with reference to the sequence listing part.
- [34974] GAM2507 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2507 target RNA, herein designated GAM TARGET RNA. GAM2507 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [34975] GAM2507 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2507 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2507 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2507 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2507 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34976] The complementary binding of GAM2507 RNA, herein designated GAM RNA, to target binding sites on GAM2507 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2507 target RNA, herein designated GAM TARGET RNA, into GAM2507 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34977] It is appreciated that GAM2507 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2507 target genes. The mRNA of each one of this plurality of GAM2507 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2507 RNA, herein designated GAM RNA, and which when bound by GAM2507 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2507 target proteins.

[34978] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2507 gene, herein designated GAM GENE, on one or more GAM2507 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34979] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2507 correlate with, and may be deduced from, the identity of the target genes which GAM2507 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34980] Nucleotide sequences of the GAM2507 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2507 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2507 are further described hereinbelow with reference to Table 1.

[34981] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2507 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[34982] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2508 (GAM2508) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34983] GAM2508 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2508 was detected is described hereinabove with reference to Figs. 2-8.

[34984] GAM2508 gene, herein designated GAM GENE, and GAM2508 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34985] GAM2508 gene, herein designated GAM GENE, encodes a GAM2508 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2508 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2508 precursor RNA is designated SEQ ID:2485, and is provided hereinbelow with reference to the sequence listing part.

[34986] GAM2508 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34987] An enzyme complex designated DICER COMPLEX, dices the GAM2508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2508 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2508 RNA is designated SEQ ID:5099, and is provided hereinbelow with reference to the sequence listing part.

[34988] GAM2508 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2508 target RNA, herein designated GAM TARGET RNA. GAM2508 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[34989] GAM2508 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2508 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2508 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2508 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2508 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[34990] The complementary binding of GAM2508 RNA, herein designated GAM RNA, to target binding sites on GAM2508 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2508 target RNA, herein designated GAM TARGET RNA, into GAM2508 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[34991] It is appreciated that GAM2508 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2508 target genes. The mRNA of each one of this plurality of GAM2508 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2508 RNA, herein designated GAM RNA, and which when bound by GAM2508 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2508 target proteins.

[34992] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2508 gene, herein designated GAM GENE, on one or more GAM2508 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[34993] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2508 correlate with, and may be deduced from, the identity of the target genes which GAM2508 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34994] Nucleotide sequences of the GAM2508 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2508 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2508 are further described hereinbelow with reference to Table 1.

[34995] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2508 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[34996] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2509 (GAM2509) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[34997] GAM2509 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2509 was detected is described hereinabove with reference to Figs. 2-8.

[34998] GAM2509 gene, herein designated GAM GENE, and GAM2509 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[34999] GAM2509 gene, herein designated GAM GENE, encodes a GAM2509 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2509 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2509 precursor RNA is designated SEQ ID:2486, and is provided hereinbelow with reference to the sequence listing part.

[35000] GAM2509 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35001] An enzyme complex designated DICER COMPLEX, dices the GAM2509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2509 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 94%) nucleotide sequence of GAM2509 RNA is designated SEQ ID:5100, and is provided hereinbelow with reference to the sequence listing part.

[35002] GAM2509 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2509 target RNA, herein designated GAM TARGET RNA. GAM2509 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35003] GAM2509 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2509 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2509 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2509 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2509 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35004] The complementary binding of GAM2509 RNA, herein designated GAM RNA, to target binding sites on GAM2509 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2509 target RNA, herein designated GAM TARGET RNA, into GAM2509 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35005] It is appreciated that GAM2509 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2509 target genes. The

mRNA of each one of this plurality of GAM2509 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2509 RNA, herein designated GAM RNA, and which when bound by GAM2509 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2509 target proteins.

[35006] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2509 gene, herein designated GAM GENE, on one or more GAM2509 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35007] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2509 correlate with, and may be deduced from, the identity of the target genes which GAM2509 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35008] Nucleotide sequences of the GAM2509 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2509 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2509 are further described hereinbelow with reference to Table 1.

[35009] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2509 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35010] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2510 (GAM2510) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35011] GAM2510 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2510 was detected is described hereinabove with reference to Figs. 2-8.

[35012] GAM2510 gene, herein designated GAM GENE, and GAM2510 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35013] GAM2510 gene, herein designated GAM GENE, encodes a GAM2510 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2510 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2510 precursor RNA is designated SEQ ID:2487, and is provided hereinbelow with reference to the sequence listing part.

[35014] GAM2510 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35015] An enzyme complex designated DICER COMPLEX, dices the GAM2510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2510 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2510 RNA is designated SEQ ID:5101, and is provided hereinbelow with reference to the sequence listing part.

[35016] GAM2510 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2510 target RNA, herein designated GAM TARGET RNA. GAM2510 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35017] GAM2510 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2510 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2510 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2510 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2510 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35018] The complementary binding of GAM2510 RNA, herein designated GAM RNA, to target binding sites on GAM2510 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2510 target RNA, herein designated GAM TARGET RNA, into GAM2510 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35019] It is appreciated that GAM2510 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2510 target genes. The mRNA of each one of this plurality of GAM2510 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2510 RNA, herein designated GAM RNA, and which when bound by GAM2510 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2510 target proteins.

[35020] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2510 gene, herein designated GAM GENE, on one or more GAM2510 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35021] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2510 correlate with, and may be deduced from, the identity of the target

genes which GAM2510 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35022] Nucleotide sequences of the GAM2510 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2510 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2510 are further described hereinbelow with reference to Table 1.

[35023] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2510 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35024] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2511 (GAM2511) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35025] GAM2511 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2511 was detected is described hereinabove with reference to Figs. 2-8.

[35026] GAM2511 gene, herein designated GAM GENE, and GAM2511 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[35027] GAM2511 gene, herein designated GAM GENE, encodes a GAM2511 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2511 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2511 precursor RNA is designated SEQ ID:2488, and is provided hereinbelow with reference to the sequence listing part.

[35028] GAM2511 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35029] An enzyme complex designated DICER COMPLEX, dices the GAM2511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2511 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2511 RNA is designated SEQ ID:5102, and is provided

hereinbelow with reference to the sequence listing part.

[35030] GAM2511 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2511 target RNA, herein designated GAM TARGET RNA. GAM2511 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35031] GAM2511 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2511 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2511 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2511 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2511 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35032] The complementary binding of GAM2511 RNA, herein designated GAM RNA, to target binding sites on GAM2511 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2511 target RNA, herein designated GAM TARGET RNA, into GAM2511 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35033] It is appreciated that GAM2511 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2511 target genes. The mRNA of each one of this plurality of GAM2511 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2511 RNA, herein designated GAM RNA, and which when bound by GAM2511 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2511 target proteins.

[35034] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2511 gene, herein designated GAM GENE, on one or more GAM2511 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35035] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2511 correlate with, and may be deduced from, the identity of the target genes which GAM2511 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35036] Nucleotide sequences of the GAM2511 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2511 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2511 are further described hereinbelow with reference to Table 1.

[35037] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2511 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35038] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2512 (GAM2512) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35039] GAM2512 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2512 was detected is described hereinabove with reference to Figs. 2-8.

[35040] GAM2512 gene, herein designated GAM GENE, and GAM2512 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35041] GAM2512 gene, herein designated GAM GENE, encodes a GAM2512 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2512 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2512 precursor RNA is designated SEQ ID:2489, and is provided hereinbelow with reference to the sequence listing part.

[35042] GAM2512 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35043] An enzyme complex designated DICER COMPLEX, dices the GAM2512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2512 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2512 RNA is designated SEQ ID:5103, and is provided hereinbelow with reference to the sequence listing part.

[35044] GAM2512 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2512 target RNA, herein designated GAM TARGET RNA. GAM2512 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35045] GAM2512 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2512 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2512 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2512 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2512 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35046] The complementary binding of GAM2512 RNA, herein designated GAM RNA, to target binding sites on GAM2512 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2512 target RNA, herein designated GAM TARGET RNA, into GAM2512 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35047] It is appreciated that GAM2512 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2512 target genes. The mRNA of each one of this plurality of GAM2512 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2512 RNA, herein designated GAM RNA, and which when bound by GAM2512 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2512 target proteins.

[35048] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2512 gene, herein designated GAM GENE, on one or more GAM2512 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35049] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2512 correlate with, and may be deduced from, the identity of the target genes which GAM2512 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35050] Nucleotide sequences of the GAM2512 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2512 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2512 are further described hereinbelow with reference to Table 1.

[35051] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2512 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35052] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2513 (GAM2513) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35053] GAM2513 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2513 was detected is described hereinabove with reference to Figs. 2-8.

[35054] GAM2513 gene, herein designated GAM GENE, and GAM2513 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35055] GAM2513 gene, herein designated GAM GENE, encodes a GAM2513 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2513 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2513 precursor RNA is designated SEQ ID:2490, and is provided hereinbelow with reference to the sequence listing part.

[35056] GAM2513 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35057] An enzyme complex designated DICER COMPLEX, dices the GAM2513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2513 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2513 RNA is designated SEQ ID:5104, and is provided hereinbelow with reference to the sequence listing part.
- [35058] GAM2513 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2513 target RNA, herein designated GAM TARGET RNA. GAM2513 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35059] GAM2513 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2513 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2513 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2513 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2513 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35060] The complementary binding of GAM2513 RNA, herein designated GAM RNA, to target binding sites on GAM2513 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2513 target RNA, herein designated GAM TARGET RNA, into GAM2513 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35061] It is appreciated that GAM2513 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2513 target genes. The mRNA of each one of this plurality of GAM2513 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2513 RNA, herein designated GAM RNA, and which when bound by GAM2513 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2513 target proteins.

[35062] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2513 gene, herein designated GAM GENE, on one or more GAM2513 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35063] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2513 correlate with, and may be deduced from, the identity of the target genes which GAM2513 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35064] Nucleotide sequences of the GAM2513 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2513 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2513 are further described hereinbelow with reference to Table 1.

[35065] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2513 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35066] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2514 (GAM2514) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35067] GAM2514 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2514 was detected is described hereinabove with reference to Figs. 2-8.

[35068] GAM2514 gene, herein designated GAM GENE, and GAM2514 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35069] GAM2514 gene, herein designated GAM GENE, encodes a GAM2514 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2514 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2514 precursor RNA is designated SEQ ID:2491, and is provided hereinbelow with reference to the sequence listing part.

[35070] GAM2514 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35071] An enzyme complex designated DICER COMPLEX, dices the GAM2514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2514 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2514 RNA is designated SEQ ID:5105, and is provided hereinbelow with reference to the sequence listing part.

[35072] GAM2514 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2514 target RNA, herein designated GAM TARGET RNA. GAM2514 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35073] GAM2514 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2514 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2514 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2514 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2514 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35074] The complementary binding of GAM2514 RNA, herein designated GAM RNA, to target binding sites on GAM2514 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2514 target RNA, herein designated GAM TARGET RNA, into GAM2514 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35075] It is appreciated that GAM2514 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2514 target genes. The mRNA of each one of this plurality of GAM2514 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2514 RNA, herein designated GAM RNA, and which when bound by GAM2514 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2514 target proteins.

[35076] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2514 gene, herein designated GAM GENE, on one or more GAM2514 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35077] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2514 correlate with, and may be deduced from, the identity of the target genes which GAM2514 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35078] Nucleotide sequences of the GAM2514 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2514 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2514 are further described hereinbelow with reference to Table 1.

[35079] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2514 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35080] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2515 (GAM2515) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35081] GAM2515 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2515 was detected is described hereinabove with reference to Figs. 2-8.

[35082] GAM2515 gene, herein designated GAM GENE, and GAM2515 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35083] GAM2515 gene, herein designated GAM GENE, encodes a GAM2515 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2515 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2515 precursor RNA is designated SEQ ID:2492, and is provided hereinbelow with reference to the sequence listing part.

[35084] GAM2515 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35085] An enzyme complex designated DICER COMPLEX, dices the GAM2515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2515 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2515 RNA is designated SEQ ID:5106, and is provided hereinbelow with reference to the sequence listing part.

[35086] GAM2515 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2515 target RNA, herein designated GAM TARGET RNA. GAM2515 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35087] GAM2515 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2515 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2515 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2515 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2515 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35088] The complementary binding of GAM2515 RNA, herein designated GAM RNA, to target binding sites on GAM2515 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2515 target RNA, herein designated GAM TARGET RNA, into GAM2515 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35089] It is appreciated that GAM2515 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2515 target genes. The

mRNA of each one of this plurality of GAM2515 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2515 RNA, herein designated GAM RNA, and which when bound by GAM2515 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2515 target proteins.

[35090] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2515 gene, herein designated GAM GENE, on one or more GAM2515 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35091] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2515 correlate with, and may be deduced from, the identity of the target genes which GAM2515 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35092] Nucleotide sequences of the GAM2515 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2515 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2515 are further described hereinbelow with reference to Table 1.

[35093] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2515 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35094] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2516 (GAM2516) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35095] GAM2516 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2516 was detected is described hereinabove with reference to Figs. 2-8.

[35096] GAM2516 gene, herein designated GAM GENE, and GAM2516 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35097] GAM2516 gene, herein designated GAM GENE, encodes a GAM2516 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2516 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2516 precursor RNA is designated SEQ ID:2493, and is provided hereinbelow with reference to the sequence listing part.

[35098] GAM2516 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35099] An enzyme complex designated DICER COMPLEX, dices the GAM2516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2516 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2516 RNA is designated SEQ ID:5107, and is provided hereinbelow with reference to the sequence listing part.

[35100] GAM2516 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2516 target RNA, herein designated GAM TARGET RNA. GAM2516 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35101] GAM2516 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2516 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2516 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2516 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2516 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35102] The complementary binding of GAM2516 RNA, herein designated GAM RNA, to target binding sites on GAM2516 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2516 target RNA, herein designated GAM TARGET RNA, into GAM2516 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35103] It is appreciated that GAM2516 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2516 target genes. The mRNA of each one of this plurality of GAM2516 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2516 RNA, herein designated GAM RNA, and which when bound by GAM2516 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2516 target proteins.

[35104] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2516 gene, herein designated GAM GENE, on one or more GAM2516 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35105] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2516 correlate with, and may be deduced from, the identity of the target

genes which GAM2516 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35106] Nucleotide sequences of the GAM2516 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2516 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2516 are further described hereinbelow with reference to Table 1.

[35107] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2516 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35108] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2517 (GAM2517) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35109] GAM2517 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2517 was detected is described hereinabove with reference to Figs. 2-8.

[35110] GAM2517 gene, herein designated GAM GENE, and GAM2517 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

- [35111] GAM2517 gene, herein designated GAM GENE, encodes a GAM2517 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2517 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2517 precursor RNA is designated SEQ ID:2494, and is provided hereinbelow with reference to the sequence listing part.
- [35112] GAM2517 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2517 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [35113] An enzyme complex designated DICER COMPLEX, dices the GAM2517 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2517 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2517 RNA is designated SEQ ID:5108, and is provided

hereinbelow with reference to the sequence listing part.

[35114] GAM2517 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2517 target RNA, herein designated GAM TARGET RNA. GAM2517 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35115] GAM2517 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2517 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2517 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2517 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2517 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35116] The complementary binding of GAM2517 RNA, herein designated GAM RNA, to target binding sites on GAM2517 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2517 target RNA, herein designated GAM TARGET RNA, into GAM2517 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35117] It is appreciated that GAM2517 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2517 target genes. The mRNA of each one of this plurality of GAM2517 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2517 RNA, herein designated GAM RNA, and which when bound by GAM2517 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2517 target proteins.

[35118] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2517 gene, herein designated GAM GENE, on one or more GAM2517 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35119] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2517 correlate with, and may be deduced from, the identity of the target genes which GAM2517 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35120] Nucleotide sequences of the GAM2517 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2517 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2517 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2517 are further described hereinbelow with reference to Table 1.

[35121] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2517 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35122] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2518 (GAM2518) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35123] GAM2518 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2518 was detected is described hereinabove with reference to Figs. 2-8.

[35124] GAM2518 gene, herein designated GAM GENE, and GAM2518 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35125] GAM2518 gene, herein designated GAM GENE, encodes a GAM2518 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2518 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2518 precursor RNA is designated SEQ ID:2495, and is provided hereinbelow with reference to the sequence listing part.

[35126] GAM2518 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35127] An enzyme complex designated DICER COMPLEX, dices the GAM2518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2518 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2518 RNA is designated SEQ ID:5109, and is provided hereinbelow with reference to the sequence listing part.

[35128] GAM2518 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2518 target RNA, herein designated GAM TARGET RNA. GAM2518 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35129] GAM2518 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2518 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2518 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2518 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2518 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35130] The complementary binding of GAM2518 RNA, herein designated GAM RNA, to target binding sites on GAM2518 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2518 target RNA, herein designated GAM TARGET RNA, into GAM2518 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35131] It is appreciated that GAM2518 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2518 target genes. The mRNA of each one of this plurality of GAM2518 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2518 RNA, herein designated GAM RNA, and which when bound by GAM2518 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2518 target proteins.

[35132] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2518 gene, herein designated GAM GENE, on one or more GAM2518 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35133] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2518 correlate with, and may be deduced from, the identity of the target genes which GAM2518 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35134] Nucleotide sequences of the GAM2518 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2518 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2518 are further described hereinbelow with reference to Table 1.

[35135] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2518 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35136] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2519 (GAM2519) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35137] GAM2519 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2519 was detected is described hereinabove with reference to Figs. 2-8.

[35138] GAM2519 gene, herein designated GAM GENE, and GAM2519 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35139] GAM2519 gene, herein designated GAM GENE, encodes a GAM2519 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2519 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2519 precursor RNA is designated SEQ ID:2496, and is provided hereinbelow with reference to the sequence listing part.

[35140] GAM2519 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35141] An enzyme complex designated DICER COMPLEX, dices the GAM2519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2519 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2519 RNA is designated SEQ ID:5110, and is provided hereinbelow with reference to the sequence listing part.
- [35142] GAM2519 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2519 target RNA, herein designated GAM TARGET RNA. GAM2519 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35143] GAM2519 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2519 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2519 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2519 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2519 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35144] The complementary binding of GAM2519 RNA, herein designated GAM RNA, to target binding sites on GAM2519 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2519 target RNA, herein designated GAM TARGET RNA, into GAM2519 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35145] It is appreciated that GAM2519 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2519 target genes. The mRNA of each one of this plurality of GAM2519 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2519 RNA, herein designated GAM RNA, and which when bound by GAM2519 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2519 target proteins.

[35146] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2519 gene, herein designated GAM GENE, on one or more GAM2519 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35147] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2519 correlate with, and may be deduced from, the identity of the target genes which GAM2519 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35148] Nucleotide sequences of the GAM2519 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2519 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2519 are further described hereinbelow with reference to Table 1.

[35149] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2519 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35150] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2520 (GAM2520) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35151] GAM2520 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2520 was detected is described hereinabove with reference to Figs. 2-8.

[35152] GAM2520 gene, herein designated GAM GENE, and GAM2520 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35153] GAM2520 gene, herein designated GAM GENE, encodes a GAM2520 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2520 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2520 precursor RNA is designated SEQ ID:2497, and is provided hereinbelow with reference to the sequence listing part.

[35154] GAM2520 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35155] An enzyme complex designated DICER COMPLEX, dices the GAM2520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2520 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2520 RNA is designated SEQ ID:5111, and is provided hereinbelow with reference to the sequence listing part.

[35156] GAM2520 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2520 target RNA, herein designated GAM TARGET RNA. GAM2520 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35157] GAM2520 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2520 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2520 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2520 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2520 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35158] The complementary binding of GAM2520 RNA, herein designated GAM RNA, to target binding sites on GAM2520 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2520 target RNA, herein designated GAM TARGET RNA, into GAM2520 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35159] It is appreciated that GAM2520 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2520 target genes. The mRNA of each one of this plurality of GAM2520 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2520 RNA, herein designated GAM RNA, and which when bound by GAM2520 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2520 target proteins.

[35160] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2520 gene, herein designated GAM GENE, on one or more GAM2520 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35161] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2520 correlate with, and may be deduced from, the identity of the target genes which GAM2520 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35162] Nucleotide sequences of the GAM2520 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2520 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2520 are further described hereinbelow with reference to Table 1.

- [35163] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2520 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [35164] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2521 (GAM2521) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [35165] GAM2521 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2521 was detected is described hereinabove with reference to Figs. 2-8.
- [35166] GAM2521 gene, herein designated GAM GENE, and GAM2521 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [35167] GAM2521 gene, herein designated GAM GENE, encodes a GAM2521 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2521 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2521 precursor RNA is designated SEQ ID:2498, and is provided hereinbelow with reference to the sequence listing part.

[35168] GAM2521 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35169] An enzyme complex designated DICER COMPLEX, dices the GAM2521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2521 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2521 RNA is designated SEQ ID:5112, and is provided hereinbelow with reference to the sequence listing part.

[35170] GAM2521 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2521 target RNA, herein designated GAM TARGET RNA. GAM2521 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35171] GAM2521 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2521 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2521 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2521 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2521 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35172] The complementary binding of GAM2521 RNA, herein designated GAM RNA, to target binding sites on GAM2521 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2521 target RNA, herein designated GAM TARGET RNA, into GAM2521 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35173] It is appreciated that GAM2521 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2521 target genes. The

mRNA of each one of this plurality of GAM2521 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2521 RNA, herein designated GAM RNA, and which when bound by GAM2521 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2521 target proteins.

[35174] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2521 gene, herein designated GAM GENE, on one or more GAM2521 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35175] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2521 correlate with, and may be deduced from, the identity of the target genes which GAM2521 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35176] Nucleotide sequences of the GAM2521 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2521 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2521 are further described hereinbelow with reference to Table 1.

[35177] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2521 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35178] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2522 (GAM2522) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35179] GAM2522 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2522 was detected is described hereinabove with reference to Figs. 2-8.

[35180] GAM2522 gene, herein designated GAM GENE, and GAM2522 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35181] GAM2522 gene, herein designated GAM GENE, encodes a GAM2522 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2522 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2522 precursor RNA is designated SEQ ID:2499, and is provided hereinbelow with reference to the sequence listing part.

[35182] GAM2522 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35183] An enzyme complex designated DICER COMPLEX, dices the GAM2522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2522 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2522 RNA is designated SEQ ID:5113, and is provided hereinbelow with reference to the sequence listing part.

[35184] GAM2522 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2522 target RNA, herein designated GAM TARGET RNA. GAM2522 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35185] GAM2522 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2522 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2522 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2522 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2522 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35186] The complementary binding of GAM2522 RNA, herein designated GAM RNA, to target binding sites on GAM2522 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2522 target RNA, herein designated GAM TARGET RNA, into GAM2522 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35187] It is appreciated that GAM2522 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2522 target genes. The mRNA of each one of this plurality of GAM2522 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2522 RNA, herein designated GAM RNA, and which when bound by GAM2522 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2522 target proteins.

[35188] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2522 gene, herein designated GAM GENE, on one or more GAM2522 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35189] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2522 correlate with, and may be deduced from, the identity of the target

genes which GAM2522 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35190] Nucleotide sequences of the GAM2522 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2522 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2522 are further described hereinbelow with reference to Table 1.

[35191] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2522 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35192] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2523 (GAM2523) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35193] GAM2523 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2523 was detected is described hereinabove with reference to Figs. 2-8.

[35194] GAM2523 gene, herein designated GAM GENE, and GAM2523 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[35195] GAM2523 gene, herein designated GAM GENE, encodes a GAM2523 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2523 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2523 precursor RNA is designated SEQ ID:2500, and is provided hereinbelow with reference to the sequence listing part.

[35196] GAM2523 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35197] An enzyme complex designated DICER COMPLEX, dices the GAM2523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2523 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2523 RNA is designated SEQ ID:5115, and is provided

hereinbelow with reference to the sequence listing part.

[35198] GAM2523 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2523 target RNA, herein designated GAM TARGET RNA. GAM2523 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35199] GAM2523 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2523 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2523 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2523 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2523 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35200] The complementary binding of GAM2523 RNA, herein designated GAM RNA, to target binding sites on GAM2523 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2523 target RNA, herein designated GAM TARGET RNA, into GAM2523 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35201] It is appreciated that GAM2523 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2523 target genes. The mRNA of each one of this plurality of GAM2523 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2523 RNA, herein designated GAM RNA, and which when bound by GAM2523 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2523 target proteins.

[35202] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2523 gene, herein designated GAM GENE, on one or more GAM2523 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35203] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2523 correlate with, and may be deduced from, the identity of the target genes which GAM2523 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35204] Nucleotide sequences of the GAM2523 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2523 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2523 are further described hereinbelow with reference to Table 1.

[35205] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2523 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35206] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2524 (GAM2524) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35207] GAM2524 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2524 was detected is described hereinabove with reference to Figs. 2-8.

[35208] GAM2524 gene, herein designated GAM GENE, and GAM2524 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35209] GAM2524 gene, herein designated GAM GENE, encodes a GAM2524 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2524 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2524 precursor RNA is designated SEQ ID:2501, and is provided hereinbelow with reference to the sequence listing part.

[35210] GAM2524 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35211] An enzyme complex designated DICER COMPLEX, dices the GAM2524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2524 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2524 RNA is designated SEQ ID:5114, and is provided hereinbelow with reference to the sequence listing part.

[35212] GAM2524 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2524 target RNA, herein designated GAM TARGET RNA. GAM2524 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35213] GAM2524 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2524 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2524 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2524 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2524 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35214] The complementary binding of GAM2524 RNA, herein designated GAM RNA, to target binding sites on GAM2524 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2524 target RNA, herein designated GAM TARGET RNA, into GAM2524 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35215] It is appreciated that GAM2524 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2524 target genes. The mRNA of each one of this plurality of GAM2524 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2524 RNA, herein designated GAM RNA, and which when bound by GAM2524 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2524 target proteins.

[35216] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2524 gene, herein designated GAM GENE, on one or more GAM2524 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35217] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2524 correlate with, and may be deduced from, the identity of the target genes which GAM2524 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35218] Nucleotide sequences of the GAM2524 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2524 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2524 are further described hereinbelow with reference to Table 1.

[35219] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2524 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35220] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2525 (GAM2525) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35221] GAM2525 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2525 was detected is described hereinabove with reference to Figs. 2-8.

[35222] GAM2525 gene, herein designated GAM GENE, and GAM2525 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35223] GAM2525 gene, herein designated GAM GENE, encodes a GAM2525 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2525 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2525 precursor RNA is designated SEQ ID:2502, and is provided hereinbelow with reference to the sequence listing part.

[35224] GAM2525 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35225] An enzyme complex designated DICER COMPLEX, dices the GAM2525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2525 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2525 RNA is designated SEQ ID:5116, and is provided hereinbelow with reference to the sequence listing part.
- [35226] GAM2525 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2525 target RNA, herein designated GAM TARGET RNA. GAM2525 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35227] GAM2525 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2525 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2525 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2525 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2525 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35228] The complementary binding of GAM2525 RNA, herein designated GAM RNA, to target binding sites on GAM2525 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2525 target RNA, herein designated GAM TARGET RNA, into GAM2525 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35229] It is appreciated that GAM2525 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2525 target genes. The mRNA of each one of this plurality of GAM2525 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2525 RNA, herein designated GAM RNA, and which when bound by GAM2525 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2525 target proteins.

[35230] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2525 gene, herein designated GAM GENE, on one or more GAM2525 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35231] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2525 correlate with, and may be deduced from, the identity of the target genes which GAM2525 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35232] Nucleotide sequences of the GAM2525 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2525 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2525 are further described hereinbelow with reference to Table 1.

[35233] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2525 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35234] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2526 (GAM2526) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35235] GAM2526 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2526 was detected is described hereinabove with reference to Figs. 2-8.

[35236] GAM2526 gene, herein designated GAM GENE, and GAM2526 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35237] GAM2526 gene, herein designated GAM GENE, encodes a GAM2526 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2526 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2526 precursor RNA is designated SEQ ID:2503, and is provided hereinbelow with reference to the sequence listing part.

[35238] GAM2526 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35239] An enzyme complex designated DICER COMPLEX, dices the GAM2526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2526 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2526 RNA is designated SEQ ID:5117, and is provided hereinbelow with reference to the sequence listing part.

[35240] GAM2526 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2526 target RNA, herein designated GAM TARGET RNA. GAM2526 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35241] GAM2526 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2526 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2526 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2526 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2526 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35242] The complementary binding of GAM2526 RNA, herein designated GAM RNA, to target binding sites on GAM2526 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2526 target RNA, herein designated GAM TARGET RNA, into GAM2526 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35243] It is appreciated that GAM2526 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2526 target genes. The mRNA of each one of this plurality of GAM2526 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2526 RNA, herein designated GAM RNA, and which when bound by GAM2526 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2526 target proteins.

[35244] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2526 gene, herein designated GAM GENE, on one or more GAM2526 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35245] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2526 correlate with, and may be deduced from, the identity of the target genes which GAM2526 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35246] Nucleotide sequences of the GAM2526 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2526 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2526 are further described hereinbelow with reference to Table 1.

[35247] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2526 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35248] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2527 (GAM2527) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35249] GAM2527 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2527 was detected is described hereinabove with reference to Figs. 2-8.

[35250] GAM2527 gene, herein designated GAM GENE, and GAM2527 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35251] GAM2527 gene, herein designated GAM GENE, encodes a GAM2527 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2527 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2527 precursor RNA is designated SEQ ID:2504, and is provided hereinbelow with reference to the sequence listing part.

[35252] GAM2527 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35253] An enzyme complex designated DICER COMPLEX, dices the GAM2527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2527 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2527 RNA is designated SEQ ID:5118, and is provided hereinbelow with reference to the sequence listing part.

[35254] GAM2527 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2527 target RNA, herein designated GAM TARGET RNA. GAM2527 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35255] GAM2527 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2527 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2527 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2527 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2527 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35256] The complementary binding of GAM2527 RNA, herein designated GAM RNA, to target binding sites on GAM2527 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2527 target RNA, herein designated GAM TARGET RNA, into GAM2527 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35257] It is appreciated that GAM2527 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2527 target genes. The

mRNA of each one of this plurality of GAM2527 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2527 RNA, herein designated GAM RNA, and which when bound by GAM2527 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2527 target proteins.

[35258] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2527 gene, herein designated GAM GENE, on one or more GAM2527 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35259] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2527 correlate with, and may be deduced from, the identity of the target genes which GAM2527 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35260] Nucleotide sequences of the GAM2527 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2527 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2527 are further described hereinbelow with reference to Table 1.

[35261] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2527 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35262] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2528 (GAM2528) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35263] GAM2528 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2528 was detected is described hereinabove with reference to Figs. 2-8.

[35264] GAM2528 gene, herein designated GAM GENE, and GAM2528 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35265] GAM2528 gene, herein designated GAM GENE, encodes a GAM2528 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2528 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2528 precursor RNA is designated SEQ ID:2505, and is provided hereinbelow with reference to the sequence listing part.

[35266] GAM2528 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35267] An enzyme complex designated DICER COMPLEX, dices the GAM2528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2528 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2528 RNA is designated SEQ ID:5119, and is provided hereinbelow with reference to the sequence listing part.

[35268] GAM2528 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2528 target RNA, herein designated GAM TARGET RNA. GAM2528 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35269] GAM2528 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2528 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2528 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2528 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2528 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35270] The complementary binding of GAM2528 RNA, herein designated GAM RNA, to target binding sites on GAM2528 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2528 target RNA, herein designated GAM TARGET RNA, into GAM2528 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35271] It is appreciated that GAM2528 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2528 target genes. The mRNA of each one of this plurality of GAM2528 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2528 RNA, herein designated GAM RNA, and which when bound by GAM2528 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2528 target proteins.

[35272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2528 gene, herein designated GAM GENE, on one or more GAM2528 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35273] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2528 correlate with, and may be deduced from, the identity of the target

genes which GAM2528 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35274] Nucleotide sequences of the GAM2528 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2528 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2528 are further described hereinbelow with reference to Table 1.

[35275] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2528 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35276] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2529 (GAM2529) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35277] GAM2529 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2529 was detected is described hereinabove with reference to Figs. 2-8.

[35278] GAM2529 gene, herein designated GAM GENE, and GAM2529 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[35279] GAM2529 gene, herein designated GAM GENE, encodes a GAM2529 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2529 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2529 precursor RNA is designated SEQ ID:2506, and is provided hereinbelow with reference to the sequence listing part.

[35280] GAM2529 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35281] An enzyme complex designated DICER COMPLEX, dices the GAM2529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2529 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2529 RNA is designated SEQ ID:5120, and is provided

hereinbelow with reference to the sequence listing part.

[35282] GAM2529 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2529 target RNA, herein designated GAM TARGET RNA. GAM2529 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35283] GAM2529 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2529 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2529 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2529 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2529 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35284] The complementary binding of GAM2529 RNA, herein designated GAM RNA, to target binding sites on GAM2529 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2529 target RNA, herein designated GAM TARGET RNA, into GAM2529 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35285] It is appreciated that GAM2529 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2529 target genes. The mRNA of each one of this plurality of GAM2529 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2529 RNA, herein designated GAM RNA, and which when bound by GAM2529 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2529 target proteins.

[35286] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2529 gene, herein designated GAM GENE, on one or more GAM2529 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35287] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2529 correlate with, and may be deduced from, the identity of the target genes which GAM2529 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35288] Nucleotide sequences of the GAM2529 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2529 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2529 are further described hereinbelow with reference to Table 1.

[35289] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2529 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35290] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2530 (GAM2530) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35291] GAM2530 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2530 was detected is described hereinabove with reference to Figs. 2-8.

[35292] GAM2530 gene, herein designated GAM GENE, and GAM2530 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35293] GAM2530 gene, herein designated GAM GENE, encodes a GAM2530 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2530 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2530 precursor RNA is designated SEQ ID:2507, and is provided hereinbelow with reference to the sequence listing part.

[35294] GAM2530 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35295] An enzyme complex designated DICER COMPLEX, dices the GAM2530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2530 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2530 RNA is designated SEQ ID:5121, and is provided hereinbelow with reference to the sequence listing part.

[35296] GAM2530 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2530 target RNA, herein designated GAM TARGET RNA. GAM2530 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35297] GAM2530 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2530 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2530 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2530 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2530 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35298] The complementary binding of GAM2530 RNA, herein designated GAM RNA, to target binding sites on GAM2530 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2530 target RNA, herein designated GAM TARGET RNA, into GAM2530 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35299] It is appreciated that GAM2530 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2530 target genes. The mRNA of each one of this plurality of GAM2530 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2530 RNA, herein designated GAM RNA, and which when bound by GAM2530 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2530 target proteins.

[35300] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2530 gene, herein designated GAM GENE, on one or more GAM2530 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35301] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2530 correlate with, and may be deduced from, the identity of the target genes which GAM2530 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35302] Nucleotide sequences of the GAM2530 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2530 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2530 are further described hereinbelow with reference to Table 1.

[35303] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2530 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35304] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2531 (GAM2531) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35305] GAM2531 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2531 was detected is described hereinabove with reference to Figs. 2-8.

[35306] GAM2531 gene, herein designated GAM GENE, and GAM2531 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35307] GAM2531 gene, herein designated GAM GENE, encodes a GAM2531 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2531 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2531 precursor RNA is designated SEQ ID:2508, and is provided hereinbelow with reference to the sequence listing part.

[35308] GAM2531 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35309] An enzyme complex designated DICER COMPLEX, dices the GAM2531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2531 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2531 RNA is designated SEQ ID:5122, and is provided hereinbelow with reference to the sequence listing part.

[35310] GAM2531 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2531 target RNA, herein designated GAM TARGET RNA. GAM2531 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35311] GAM2531 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2531 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2531 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2531 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2531 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35312] The complementary binding of GAM2531 RNA, herein designated GAM RNA, to target binding sites on GAM2531 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2531 target RNA, herein designated GAM TARGET RNA, into GAM2531 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35313] It is appreciated that GAM2531 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2531 target genes. The mRNA of each one of this plurality of GAM2531 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2531 RNA, herein designated GAM RNA, and which when bound by GAM2531 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2531 target proteins.

[35314] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2531 gene, herein designated GAM GENE, on one or more GAM2531 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35315] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2531 correlate with, and may be deduced from, the identity of the target genes which GAM2531 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35316] Nucleotide sequences of the GAM2531 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2531 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2531 are further described hereinbelow with reference to Table 1.

[35317] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2531 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35318] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2532 (GAM2532) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35319] GAM2532 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2532 was detected is described hereinabove with reference to Figs. 2-8.

[35320] GAM2532 gene, herein designated GAM GENE, and GAM2532 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35321] GAM2532 gene, herein designated GAM GENE, encodes a GAM2532 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2532 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2532 precursor RNA is designated SEQ ID:2509, and is provided hereinbelow with reference to the sequence listing part.

[35322] GAM2532 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35323] An enzyme complex designated DICER COMPLEX, dices the GAM2532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2532 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2532 RNA is designated SEQ ID:5123, and is provided hereinbelow with reference to the sequence listing part.

[35324] GAM2532 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2532 target RNA, herein designated GAM TARGET RNA. GAM2532 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35325] GAM2532 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2532 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2532 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2532 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2532 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35326] The complementary binding of GAM2532 RNA, herein designated GAM RNA, to target binding sites on GAM2532 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2532 target RNA, herein designated GAM TARGET RNA, into GAM2532 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35327] It is appreciated that GAM2532 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2532 target genes. The mRNA of each one of this plurality of GAM2532 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2532 RNA, herein designated GAM RNA, and which when bound by GAM2532 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2532 target proteins.

[35328] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2532 gene, herein designated GAM GENE, on one or more GAM2532 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35329] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2532 correlate with, and may be deduced from, the identity of the target genes which GAM2532 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35330] Nucleotide sequences of the GAM2532 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2532 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2532 are further described hereinbelow with reference to Table 1.

[35331] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2532 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35332] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2533 (GAM2533) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35333] GAM2533 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2533 was detected is described hereinabove with reference to Figs. 2-8.

[35334] GAM2533 gene, herein designated GAM GENE, and GAM2533 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35335] GAM2533 gene, herein designated GAM GENE, encodes a GAM2533 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2533 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2533 precursor RNA is designated SEQ ID:2510, and is provided hereinbelow with reference to the sequence listing part.

[35336] GAM2533 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35337] An enzyme complex designated DICER COMPLEX, dices the GAM2533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2533 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2533 RNA is designated SEQ ID:5124, and is provided hereinbelow with reference to the sequence listing part.

[35338] GAM2533 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2533 target RNA, herein designated GAM TARGET RNA. GAM2533 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35339] GAM2533 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2533 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2533 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2533 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2533 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35340] The complementary binding of GAM2533 RNA, herein designated GAM RNA, to target binding sites on GAM2533 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2533 target RNA, herein designated GAM TARGET RNA, into GAM2533 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35341] It is appreciated that GAM2533 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2533 target genes. The

mRNA of each one of this plurality of GAM2533 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2533 RNA, herein designated GAM RNA, and which when bound by GAM2533 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2533 target proteins.

[35342] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2533 gene, herein designated GAM GENE, on one or more GAM2533 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35343] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2533 correlate with, and may be deduced from, the identity of the target genes which GAM2533 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35344] Nucleotide sequences of the GAM2533 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2533 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2533 are further described hereinbelow with reference to Table 1.

[35345] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2533 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35346] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2534 (GAM2534) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35347] GAM2534 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2534 was detected is described hereinabove with reference to Figs. 2-8.

[35348] GAM2534 gene, herein designated GAM GENE, and GAM2534 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35349] GAM2534 gene, herein designated GAM GENE, encodes a GAM2534 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2534 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2534 precursor RNA is designated SEQ ID:2511, and is provided hereinbelow with reference to the sequence listing part.

[35350] GAM2534 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35351] An enzyme complex designated DICER COMPLEX, dices the GAM2534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2534 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2534 RNA is designated SEQ ID:5125, and is provided hereinbelow with reference to the sequence listing part.

[35352] GAM2534 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2534 target RNA, herein designated GAM TARGET RNA. GAM2534 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35353] GAM2534 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2534 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2534 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2534 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2534 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35354] The complementary binding of GAM2534 RNA, herein designated GAM RNA, to target binding sites on GAM2534 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2534 target RNA, herein designated GAM TARGET RNA, into GAM2534 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35355] It is appreciated that GAM2534 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2534 target genes. The mRNA of each one of this plurality of GAM2534 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2534 RNA, herein designated GAM RNA, and which when bound by GAM2534 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2534 target proteins.

[35356] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2534 gene, herein designated GAM GENE, on one or more GAM2534 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35357] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2534 correlate with, and may be deduced from, the identity of the target

genes which GAM2534 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35358] Nucleotide sequences of the GAM2534 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2534 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2534 are further described hereinbelow with reference to Table 1.

[35359] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2534 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35360] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2535 (GAM2535) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35361] GAM2535 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2535 was detected is described hereinabove with reference to Figs. 2-8.

[35362] GAM2535 gene, herein designated GAM GENE, and GAM2535 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[35363] GAM2535 gene, herein designated GAM GENE, encodes a GAM2535 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2535 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2535 precursor RNA is designated SEQ ID:2512, and is provided hereinbelow with reference to the sequence listing part.

[35364] GAM2535 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35365] An enzyme complex designated DICER COMPLEX, dices the GAM2535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2535 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2535 RNA is designated SEQ ID:5126, and is provided

hereinbelow with reference to the sequence listing part.

[35366] GAM2535 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2535 target RNA, herein designated GAM TARGET RNA. GAM2535 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35367] GAM2535 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2535 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2535 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2535 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2535 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35368] The complementary binding of GAM2535 RNA, herein designated GAM RNA, to target binding sites on GAM2535 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2535 target RNA, herein designated GAM TARGET RNA, into GAM2535 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35369] It is appreciated that GAM2535 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2535 target genes. The mRNA of each one of this plurality of GAM2535 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2535 RNA, herein designated GAM RNA, and which when bound by GAM2535 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2535 target proteins.

[35370] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2535 gene, herein designated GAM GENE, on one or more GAM2535 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35371] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2535 correlate with, and may be deduced from, the identity of the target genes which GAM2535 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35372] Nucleotide sequences of the GAM2535 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2535 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2535 are further described hereinbelow with reference to Table 1.

[35373] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2535 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35374] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2536 (GAM2536) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35375] GAM2536 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2536 was detected is described hereinabove with reference to Figs. 2-8.

[35376] GAM2536 gene, herein designated GAM GENE, and GAM2536 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35377] GAM2536 gene, herein designated GAM GENE, encodes a GAM2536 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2536 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2536 precursor RNA is designated SEQ ID:2513, and is provided hereinbelow with reference to the sequence listing part.

[35378] GAM2536 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35379] An enzyme complex designated DICER COMPLEX, dices the GAM2536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2536 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2536 RNA is designated SEQ ID:5127, and is provided hereinbelow with reference to the sequence listing part.

[35380] GAM2536 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2536 target RNA, herein designated GAM TARGET RNA. GAM2536 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35381] GAM2536 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2536 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2536 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2536 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2536 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35382] The complementary binding of GAM2536 RNA, herein designated GAM RNA, to target binding sites on GAM2536 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2536 target RNA, herein designated GAM TARGET RNA, into GAM2536 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35383] It is appreciated that GAM2536 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2536 target genes. The mRNA of each one of this plurality of GAM2536 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2536 RNA, herein designated GAM RNA, and which when bound by GAM2536 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2536 target proteins.

[35384] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2536 gene, herein designated GAM GENE, on one or more GAM2536 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35385] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2536 correlate with, and may be deduced from, the identity of the target genes which GAM2536 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35386] Nucleotide sequences of the GAM2536 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2536 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2536 are further described hereinbelow with reference to Table 1.

[35387] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2536 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35388] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2537 (GAM2537) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35389] GAM2537 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2537 was detected is described hereinabove with reference to Figs. 2-8.

[35390] GAM2537 gene, herein designated GAM GENE, and GAM2537 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35391] GAM2537 gene, herein designated GAM GENE, encodes a GAM2537 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2537 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2537 precursor RNA is designated SEQ ID:2514, and is provided hereinbelow with reference to the sequence listing part.

[35392] GAM2537 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35393] An enzyme complex designated DICER COMPLEX, dices the GAM2537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2537 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM2537 RNA is designated SEQ ID:5128, and is provided hereinbelow with reference to the sequence listing part.
- [35394] GAM2537 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2537 target RNA, herein designated GAM TARGET RNA. GAM2537 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35395] GAM2537 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2537 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2537 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2537 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2537 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35396] The complementary binding of GAM2537 RNA, herein designated GAM RNA, to target binding sites on GAM2537 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2537 target RNA, herein designated GAM TARGET RNA, into GAM2537 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35397] It is appreciated that GAM2537 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2537 target genes. The mRNA of each one of this plurality of GAM2537 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2537 RNA, herein designated GAM RNA, and which when bound by GAM2537 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2537 target proteins.

[35398] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2537 gene, herein designated GAM GENE, on one or more GAM2537 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35399] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2537 correlate with, and may be deduced from, the identity of the target genes which GAM2537 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35400] Nucleotide sequences of the GAM2537 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2537 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2537 are further described hereinbelow with reference to Table 1.

[35401] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2537 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35402] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2538 (GAM2538) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35403] GAM2538 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2538 was detected is described hereinabove with reference to Figs. 2-8.

[35404] GAM2538 gene, herein designated GAM GENE, and GAM2538 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35405] GAM2538 gene, herein designated GAM GENE, encodes a GAM2538 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2538 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2538 precursor RNA is designated SEQ ID:2515, and is provided hereinbelow with reference to the sequence listing part.

[35406] GAM2538 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35407] An enzyme complex designated DICER COMPLEX, dices the GAM2538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2538 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2538 RNA is designated SEQ ID:5129, and is provided hereinbelow with reference to the sequence listing part.

[35408] GAM2538 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2538 target RNA, herein designated GAM TARGET RNA. GAM2538 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35409] GAM2538 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2538 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2538 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2538 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2538 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35410] The complementary binding of GAM2538 RNA, herein designated GAM RNA, to target binding sites on GAM2538 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2538 target RNA, herein designated GAM TARGET RNA, into GAM2538 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35411] It is appreciated that GAM2538 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2538 target genes. The mRNA of each one of this plurality of GAM2538 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2538 RNA, herein designated GAM RNA, and which when bound by GAM2538 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2538 target proteins.

[35412] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2538 gene, herein designated GAM GENE, on one or more GAM2538 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35413] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2538 correlate with, and may be deduced from, the identity of the target genes which GAM2538 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35414] Nucleotide sequences of the GAM2538 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2538 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2538 are further described hereinbelow with reference to Table 1.

- [35415] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2538 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [35416] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2539 (GAM2539) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [35417] GAM2539 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2539 was detected is described hereinabove with reference to Figs. 2-8.
- [35418] GAM2539 gene, herein designated GAM GENE, and GAM2539 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [35419] GAM2539 gene, herein designated GAM GENE, encodes a GAM2539 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2539 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2539 precursor RNA is designated SEQ ID:2516, and is provided hereinbelow with reference to the sequence listing part.

[35420] GAM2539 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35421] An enzyme complex designated DICER COMPLEX, dices the GAM2539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2539 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2539 RNA is designated SEQ ID:5130, and is provided hereinbelow with reference to the sequence listing part.

[35422] GAM2539 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2539 target RNA, herein designated GAM TARGET RNA. GAM2539 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35423] GAM2539 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2539 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2539 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2539 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2539 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35424] The complementary binding of GAM2539 RNA, herein designated GAM RNA, to target binding sites on GAM2539 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2539 target RNA, herein designated GAM TARGET RNA, into GAM2539 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35425] It is appreciated that GAM2539 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2539 target genes. The

mRNA of each one of this plurality of GAM2539 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2539 RNA, herein designated GAM RNA, and which when bound by GAM2539 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2539 target proteins.

[35426] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2539 gene, herein designated GAM GENE, on one or more GAM2539 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35427] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2539 correlate with, and may be deduced from, the identity of the target genes which GAM2539 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35428] Nucleotide sequences of the GAM2539 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2539 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2539 are further described hereinbelow with reference to Table 1.

[35429] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2539 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35430] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2540 (GAM2540) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35431] GAM2540 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2540 was detected is described hereinabove with reference to Figs. 2-8.

[35432] GAM2540 gene, herein designated GAM GENE, and GAM2540 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35433] GAM2540 gene, herein designated GAM GENE, encodes a GAM2540 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2540 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2540 precursor RNA is designated SEQ ID:2517, and is provided hereinbelow with reference to the sequence listing part.

[35434] GAM2540 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35435] An enzyme complex designated DICER COMPLEX, dices the GAM2540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2540 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2540 RNA is designated SEQ ID:5131, and is provided hereinbelow with reference to the sequence listing part.

[35436] GAM2540 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2540 target RNA, herein designated GAM TARGET RNA. GAM2540 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35437] GAM2540 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2540 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2540 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2540 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2540 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35438] The complementary binding of GAM2540 RNA, herein designated GAM RNA, to target binding sites on GAM2540 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2540 target RNA, herein designated GAM TARGET RNA, into GAM2540 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35439] It is appreciated that GAM2540 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2540 target genes. The mRNA of each one of this plurality of GAM2540 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2540 RNA, herein designated GAM RNA, and which when bound by GAM2540 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2540 target proteins.

[35440] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2540 gene, herein designated GAM GENE, on one or more GAM2540 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35441] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2540 correlate with, and may be deduced from, the identity of the target

genes which GAM2540 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35442] Nucleotide sequences of the GAM2540 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2540 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2540 are further described hereinbelow with reference to Table 1.

[35443] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2540 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35444] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2541 (GAM2541) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35445] GAM2541 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2541 was detected is described hereinabove with reference to Figs. 2-8.

[35446] GAM2541 gene, herein designated GAM GENE, and GAM2541 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[35447] GAM2541 gene, herein designated GAM GENE, encodes a GAM2541 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2541 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2541 precursor RNA is designated SEQ ID:2518, and is provided hereinbelow with reference to the sequence listing part.

[35448] GAM2541 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35449] An enzyme complex designated DICER COMPLEX, dices the GAM2541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2541 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2541 RNA is designated SEQ ID:5132, and is provided

hereinbelow with reference to the sequence listing part.

[35450] GAM2541 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2541 target RNA, herein designated GAM TARGET RNA. GAM2541 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35451] GAM2541 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2541 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2541 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2541 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2541 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35452] The complementary binding of GAM2541 RNA, herein designated GAM RNA, to target binding sites on GAM2541 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2541 target RNA, herein designated GAM TARGET RNA, into GAM2541 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35453] It is appreciated that GAM2541 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2541 target genes. The mRNA of each one of this plurality of GAM2541 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2541 RNA, herein designated GAM RNA, and which when bound by GAM2541 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2541 target proteins.

[35454] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2541 gene, herein designated GAM GENE, on one or more GAM2541 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35455] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2541 correlate with, and may be deduced from, the identity of the target genes which GAM2541 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35456] Nucleotide sequences of the GAM2541 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2541 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2541 are further described hereinbelow with reference to Table 1.

[35457] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2541 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35458] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2542 (GAM2542) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35459] GAM2542 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2542 was detected is described hereinabove with reference to Figs. 2-8.

[35460] GAM2542 gene, herein designated GAM GENE, and GAM2542 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35461] GAM2542 gene, herein designated GAM GENE, encodes a GAM2542 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2542 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2542 precursor RNA is designated SEQ ID:2519, and is provided hereinbelow with reference to the sequence listing part.

[35462] GAM2542 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35463] An enzyme complex designated DICER COMPLEX, dices the GAM2542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2542 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM2542 RNA is designated SEQ ID:5133, and is provided hereinbelow with reference to the sequence listing part.

[35464] GAM2542 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2542 target RNA, herein designated GAM TARGET RNA. GAM2542 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35465] GAM2542 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2542 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2542 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2542 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2542 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35466] The complementary binding of GAM2542 RNA, herein designated GAM RNA, to target binding sites on GAM2542 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2542 target RNA, herein designated GAM TARGET RNA, into GAM2542 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35467] It is appreciated that GAM2542 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2542 target genes. The mRNA of each one of this plurality of GAM2542 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2542 RNA, herein designated GAM RNA, and which when bound by GAM2542 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2542 target proteins.

[35468] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2542 gene, herein designated GAM GENE, on one or more GAM2542 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35469] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2542 correlate with, and may be deduced from, the identity of the target genes which GAM2542 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35470] Nucleotide sequences of the GAM2542 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2542 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2542 are further described hereinbelow with reference to Table 1.

[35471] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2542 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35472] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2543 (GAM2543) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35473] GAM2543 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2543 was detected is described hereinabove with reference to Figs. 2-8.

[35474] GAM2543 gene, herein designated GAM GENE, and GAM2543 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35475] GAM2543 gene, herein designated GAM GENE, encodes a GAM2543 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2543 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2543 precursor RNA is designated SEQ ID:2520, and is provided hereinbelow with reference to the sequence listing part.

[35476] GAM2543 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35477] An enzyme complex designated DICER COMPLEX, dices the GAM2543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2543 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2543 RNA is designated SEQ ID:5134, and is provided hereinbelow with reference to the sequence listing part.
- [35478] GAM2543 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2543 target RNA, herein designated GAM TARGET RNA. GAM2543 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35479] GAM2543 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2543 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2543 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2543 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2543 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35480] The complementary binding of GAM2543 RNA, herein designated GAM RNA, to target binding sites on GAM2543 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2543 target RNA, herein designated GAM TARGET RNA, into GAM2543 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35481] It is appreciated that GAM2543 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2543 target genes. The mRNA of each one of this plurality of GAM2543 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2543 RNA, herein designated GAM RNA, and which when bound by GAM2543 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2543 target proteins.

[35482] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2543 gene, herein designated GAM GENE, on one or more GAM2543 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35483] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2543 correlate with, and may be deduced from, the identity of the target genes which GAM2543 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35484] Nucleotide sequences of the GAM2543 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2543 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2543 are further described hereinbelow with reference to Table 1.

[35485] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2543 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35486] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2544 (GAM2544) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35487] GAM2544 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2544 was detected is described hereinabove with reference to Figs. 2-8.

[35488] GAM2544 gene, herein designated GAM GENE, and GAM2544 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35489] GAM2544 gene, herein designated GAM GENE, encodes a GAM2544 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2544 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2544 precursor RNA is designated SEQ ID:2521, and is provided hereinbelow with reference to the sequence listing part.

[35490] GAM2544 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35491] An enzyme complex designated DICER COMPLEX, dices the GAM2544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2544 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2544 RNA is designated SEQ ID:5135, and is provided hereinbelow with reference to the sequence listing part.

[35492] GAM2544 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2544 target RNA, herein designated GAM TARGET RNA. GAM2544 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35493] GAM2544 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2544 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2544 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2544 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2544 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35494] The complementary binding of GAM2544 RNA, herein designated GAM RNA, to target binding sites on GAM2544 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2544 target RNA, herein designated GAM TARGET RNA, into GAM2544 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35495] It is appreciated that GAM2544 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2544 target genes. The mRNA of each one of this plurality of GAM2544 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2544 RNA, herein designated GAM RNA, and which when bound by GAM2544 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2544 target proteins.

[35496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2544 gene, herein designated GAM GENE, on one or more GAM2544 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35497] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2544 correlate with, and may be deduced from, the identity of the target genes which GAM2544 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35498] Nucleotide sequences of the GAM2544 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2544 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2544 are further described hereinbelow with reference to Table 1.

[35499] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2544 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35500] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2545 (GAM2545) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35501] GAM2545 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2545 was detected is described hereinabove with reference to Figs. 2-8.

[35502] GAM2545 gene, herein designated GAM GENE, and GAM2545 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35503] GAM2545 gene, herein designated GAM GENE, encodes a GAM2545 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2545 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2545 precursor RNA is designated SEQ ID:2522, and is provided hereinbelow with reference to the sequence listing part.

[35504] GAM2545 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35505] An enzyme complex designated DICER COMPLEX, dices the GAM2545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2545 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2545 RNA is designated SEQ ID:5136, and is provided hereinbelow with reference to the sequence listing part.

[35506] GAM2545 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2545 target RNA, herein designated GAM TARGET RNA. GAM2545 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35507] GAM2545 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2545 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2545 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2545 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2545 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35508] The complementary binding of GAM2545 RNA, herein designated GAM RNA, to target binding sites on GAM2545 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2545 target RNA, herein designated GAM TARGET RNA, into GAM2545 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35509] It is appreciated that GAM2545 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2545 target genes. The

mRNA of each one of this plurality of GAM2545 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2545 RNA, herein designated GAM RNA, and which when bound by GAM2545 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2545 target proteins.

[35510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2545 gene, herein designated GAM GENE, on one or more GAM2545 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35511] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2545 correlate with, and may be deduced from, the identity of the target genes which GAM2545 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35512] Nucleotide sequences of the GAM2545 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2545 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2545 are further described hereinbelow with reference to Table 1.

[35513] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2545 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35514] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2546 (GAM2546) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35515] GAM2546 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2546 was detected is described hereinabove with reference to Figs. 2-8.

[35516] GAM2546 gene, herein designated GAM GENE, and GAM2546 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35517] GAM2546 gene, herein designated GAM GENE, encodes a GAM2546 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2546 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2546 precursor RNA is designated SEQ ID:2523, and is provided hereinbelow with reference to the sequence listing part.

[35518] GAM2546 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35519] An enzyme complex designated DICER COMPLEX, dices the GAM2546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2546 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2546 RNA is designated SEQ ID:5137, and is provided hereinbelow with reference to the sequence listing part.

[35520] GAM2546 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2546 target RNA, herein designated GAM TARGET RNA. GAM2546 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35521] GAM2546 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2546 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2546 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2546 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2546 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35522] The complementary binding of GAM2546 RNA, herein designated GAM RNA, to target binding sites on GAM2546 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2546 target RNA, herein designated GAM TARGET RNA, into GAM2546 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35523] It is appreciated that GAM2546 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2546 target genes. The mRNA of each one of this plurality of GAM2546 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2546 RNA, herein designated GAM RNA, and which when bound by GAM2546 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2546 target proteins.

[35524] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2546 gene, herein designated GAM GENE, on one or more GAM2546 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35525] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2546 correlate with, and may be deduced from, the identity of the target

genes which GAM2546 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35526] Nucleotide sequences of the GAM2546 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2546 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2546 are further described hereinbelow with reference to Table 1.

[35527] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2546 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35528] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2547 (GAM2547) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35529] GAM2547 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2547 was detected is described hereinabove with reference to Figs. 2-8.

[35530] GAM2547 gene, herein designated GAM GENE, and GAM2547 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[35531] GAM2547 gene, herein designated GAM GENE, encodes a GAM2547 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2547 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2547 precursor RNA is designated SEQ ID:2524, and is provided hereinbelow with reference to the sequence listing part.

[35532] GAM2547 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35533] An enzyme complex designated DICER COMPLEX, dices the GAM2547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2547 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2547 RNA is designated SEQ ID:5138, and is provided

hereinbelow with reference to the sequence listing part.

[35534] GAM2547 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2547 target RNA, herein designated GAM TARGET RNA. GAM2547 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35535] GAM2547 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2547 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2547 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2547 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2547 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35536] The complementary binding of GAM2547 RNA, herein designated GAM RNA, to target binding sites on GAM2547 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2547 target RNA, herein designated GAM TARGET RNA, into GAM2547 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35537] It is appreciated that GAM2547 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2547 target genes. The mRNA of each one of this plurality of GAM2547 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2547 RNA, herein designated GAM RNA, and which when bound by GAM2547 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2547 target proteins.

[35538] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2547 gene, herein designated GAM GENE, on one or more GAM2547 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35539] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2547 correlate with, and may be deduced from, the identity of the target genes which GAM2547 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35540] Nucleotide sequences of the GAM2547 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2547 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2547 are further described hereinbelow with reference to Table 1.

[35541] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2547 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35542] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2548 (GAM2548) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35543] GAM2548 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2548 was detected is described hereinabove with reference to Figs. 2-8.

[35544] GAM2548 gene, herein designated GAM GENE, and GAM2548 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35545] GAM2548 gene, herein designated GAM GENE, encodes a GAM2548 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2548 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2548 precursor RNA is designated SEQ ID:2525, and is provided hereinbelow with reference to the sequence listing part.

[35546] GAM2548 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35547] An enzyme complex designated DICER COMPLEX, dices the GAM2548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2548 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2548 RNA is designated SEQ ID:5139, and is provided hereinbelow with reference to the sequence listing part.

[35548] GAM2548 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2548 target RNA, herein designated GAM TARGET RNA. GAM2548 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35549] GAM2548 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2548 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2548 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2548 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2548 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35550] The complementary binding of GAM2548 RNA, herein designated GAM RNA, to target binding sites on GAM2548 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2548 target RNA, herein designated GAM TARGET RNA, into GAM2548 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35551] It is appreciated that GAM2548 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2548 target genes. The mRNA of each one of this plurality of GAM2548 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2548 RNA, herein designated GAM RNA, and which when bound by GAM2548 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2548 target proteins.

[35552] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2548 gene, herein designated GAM GENE, on one or more GAM2548 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35553] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2548 correlate with, and may be deduced from, the identity of the target genes which GAM2548 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35554] Nucleotide sequences of the GAM2548 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2548 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2548 are further described hereinbelow with reference to Table 1.

[35555] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2548 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35556] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2549 (GAM2549) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35557] GAM2549 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2549 was detected is described hereinabove with reference to Figs. 2-8.

[35558] GAM2549 gene, herein designated GAM GENE, and GAM2549 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35559] GAM2549 gene, herein designated GAM GENE, encodes a GAM2549 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2549 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2549 precursor RNA is designated SEQ ID:2526, and is provided hereinbelow with reference to the sequence listing part.

[35560] GAM2549 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35561] An enzyme complex designated DICER COMPLEX, dices the GAM2549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2549 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2549 RNA is designated SEQ ID:5140, and is provided hereinbelow with reference to the sequence listing part.
- [35562] GAM2549 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2549 target RNA, herein designated GAM TARGET RNA. GAM2549 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35563] GAM2549 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2549 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2549 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2549 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2549 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35564] The complementary binding of GAM2549 RNA, herein designated GAM RNA, to target binding sites on GAM2549 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2549 target RNA, herein designated GAM TARGET RNA, into GAM2549 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35565] It is appreciated that GAM2549 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2549 target genes. The mRNA of each one of this plurality of GAM2549 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2549 RNA, herein designated GAM RNA, and which when bound by GAM2549 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2549 target proteins.

[35566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2549 gene, herein designated GAM GENE, on one or more GAM2549 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35567] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2549 correlate with, and may be deduced from, the identity of the target genes which GAM2549 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35568] Nucleotide sequences of the GAM2549 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2549 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2549 are further described hereinbelow with reference to Table 1.

[35569] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2549 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35570] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2550 (GAM2550) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35571] GAM2550 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2550 was detected is described hereinabove with reference to Figs. 2-8.

[35572] GAM2550 gene, herein designated GAM GENE, and GAM2550 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35573] GAM2550 gene, herein designated GAM GENE, encodes a GAM2550 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2550 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2550 precursor RNA is designated SEQ ID:2527, and is provided hereinbelow with reference to the sequence listing part.

[35574] GAM2550 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35575] An enzyme complex designated DICER COMPLEX, dices the GAM2550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2550 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2550 RNA is designated SEQ ID:5142, and is provided hereinbelow with reference to the sequence listing part.

[35576] GAM2550 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2550 target RNA, herein designated GAM TARGET RNA. GAM2550 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35577] GAM2550 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2550 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2550 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2550 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2550 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35578] The complementary binding of GAM2550 RNA, herein designated GAM RNA, to target binding sites on GAM2550 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2550 target RNA, herein designated GAM TARGET RNA, into GAM2550 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35579] It is appreciated that GAM2550 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2550 target genes. The mRNA of each one of this plurality of GAM2550 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2550 RNA, herein designated GAM RNA, and which when bound by GAM2550 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2550 target proteins.

[35580] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2550 gene, herein designated GAM GENE, on one or more GAM2550 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35581] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2550 correlate with, and may be deduced from, the identity of the target genes which GAM2550 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35582] Nucleotide sequences of the GAM2550 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2550 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2550 are further described hereinbelow with reference to Table 1.

[35583] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2550 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35584] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2551 (GAM2551) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35585] GAM2551 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2551 was detected is described hereinabove with reference to Figs. 2-8.

[35586] GAM2551 gene, herein designated GAM GENE, and GAM2551 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35587] GAM2551 gene, herein designated GAM GENE, encodes a GAM2551 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2551 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2551 precursor RNA is designated SEQ ID:2528, and is provided hereinbelow with reference to the sequence listing part.

[35588] GAM2551 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35589] An enzyme complex designated DICER COMPLEX, dices the GAM2551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2551 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2551 RNA is designated SEQ ID:5141, and is provided hereinbelow with reference to the sequence listing part.

[35590] GAM2551 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2551 target RNA, herein designated GAM TARGET RNA. GAM2551 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35591] GAM2551 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2551 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2551 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2551 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2551 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35592] The complementary binding of GAM2551 RNA, herein designated GAM RNA, to target binding sites on GAM2551 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2551 target RNA, herein designated GAM TARGET RNA, into GAM2551 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35593] It is appreciated that GAM2551 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2551 target genes. The

mRNA of each one of this plurality of GAM2551 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2551 RNA, herein designated GAM RNA, and which when bound by GAM2551 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2551 target proteins.

[35594] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2551 gene, herein designated GAM GENE, on one or more GAM2551 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35595] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2551 correlate with, and may be deduced from, the identity of the target genes which GAM2551 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35596] Nucleotide sequences of the GAM2551 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2551 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2551 are further described hereinbelow with reference to Table 1.

[35597] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2551 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35598] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2552 (GAM2552) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35599] GAM2552 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2552 was detected is described hereinabove with reference to Figs. 2-8.

[35600] GAM2552 gene, herein designated GAM GENE, and GAM2552 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35601] GAM2552 gene, herein designated GAM GENE, encodes a GAM2552 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2552 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2552 precursor RNA is designated SEQ ID:2529, and is provided hereinbelow with reference to the sequence listing part.

[35602] GAM2552 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35603] An enzyme complex designated DICER COMPLEX, dices the GAM2552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2552 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2552 RNA is designated SEQ ID:5143, and is provided hereinbelow with reference to the sequence listing part.

[35604] GAM2552 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2552 target RNA, herein designated GAM TARGET RNA. GAM2552 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35605] GAM2552 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2552 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2552 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2552 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2552 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35606] The complementary binding of GAM2552 RNA, herein designated GAM RNA, to target binding sites on GAM2552 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2552 target RNA, herein designated GAM TARGET RNA, into GAM2552 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35607] It is appreciated that GAM2552 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2552 target genes. The mRNA of each one of this plurality of GAM2552 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2552 RNA, herein designated GAM RNA, and which when bound by GAM2552 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2552 target proteins.

[35608] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2552 gene, herein designated GAM GENE, on one or more GAM2552 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35609] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2552 correlate with, and may be deduced from, the identity of the target

genes which GAM2552 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35610] Nucleotide sequences of the GAM2552 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2552 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2552 are further described hereinbelow with reference to Table 1.

[35611] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2552 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35612] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2553 (GAM2553) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35613] GAM2553 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2553 was detected is described hereinabove with reference to Figs. 2-8.

[35614] GAM2553 gene, herein designated GAM GENE, and GAM2553 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[35615] GAM2553 gene, herein designated GAM GENE, encodes a GAM2553 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2553 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2553 precursor RNA is designated SEQ ID:2530, and is provided hereinbelow with reference to the sequence listing part.

[35616] GAM2553 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35617] An enzyme complex designated DICER COMPLEX, dices the GAM2553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2553 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2553 RNA is designated SEQ ID:5144, and is provided

hereinbelow with reference to the sequence listing part.

[35618] GAM2553 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2553 target RNA, herein designated GAM TARGET RNA. GAM2553 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35619] GAM2553 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2553 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2553 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2553 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2553 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35620] The complementary binding of GAM2553 RNA, herein designated GAM RNA, to target binding sites on GAM2553 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2553 target RNA, herein designated GAM TARGET RNA, into GAM2553 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35621] It is appreciated that GAM2553 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2553 target genes. The mRNA of each one of this plurality of GAM2553 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2553 RNA, herein designated GAM RNA, and which when bound by GAM2553 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2553 target proteins.

[35622] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2553 gene, herein designated GAM GENE, on one or more GAM2553 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35623] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2553 correlate with, and may be deduced from, the identity of the target genes which GAM2553 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35624] Nucleotide sequences of the GAM2553 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2553 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2553 are further described hereinbelow with reference to Table 1.

[35625] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2553 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35626] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2554 (GAM2554) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35627] GAM2554 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2554 was detected is described hereinabove with reference to Figs. 2-8.

[35628] GAM2554 gene, herein designated GAM GENE, and GAM2554 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35629] GAM2554 gene, herein designated GAM GENE, encodes a GAM2554 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2554 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2554 precursor RNA is designated SEQ ID:2531, and is provided hereinbelow with reference to the sequence listing part.

[35630] GAM2554 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35631] An enzyme complex designated DICER COMPLEX, dices the GAM2554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2554 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2554 RNA is designated SEQ ID:5145, and is provided hereinbelow with reference to the sequence listing part.

[35632] GAM2554 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2554 target RNA, herein designated GAM TARGET RNA. GAM2554 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35633] GAM2554 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2554 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2554 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2554 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2554 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35634] The complementary binding of GAM2554 RNA, herein designated GAM RNA, to target binding sites on GAM2554 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2554 target RNA, herein designated GAM TARGET RNA, into GAM2554 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35635] It is appreciated that GAM2554 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2554 target genes. The mRNA of each one of this plurality of GAM2554 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2554 RNA, herein designated GAM RNA, and which when bound by GAM2554 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2554 target proteins.

[35636] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2554 gene, herein designated GAM GENE, on one or more GAM2554 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35637] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2554 correlate with, and may be deduced from, the identity of the target genes which GAM2554 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35638] Nucleotide sequences of the GAM2554 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2554 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2554 are further described hereinbelow with reference to Table 1.

[35639] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2554 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35640] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2555 (GAM2555) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [35641] GAM2555 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2555 was detected is described hereinabove with reference to Figs. 2-8.
- [35642] GAM2555 gene, herein designated GAM GENE, and GAM2555 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [35643] GAM2555 gene, herein designated GAM GENE, encodes a GAM2555 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2555 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2555 precursor RNA is designated SEQ ID:2532, and is provided hereinbelow with reference to the sequence listing part.
- [35644] GAM2555 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35645] An enzyme complex designated DICER COMPLEX, dices the GAM2555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2555 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM2555 RNA is designated SEQ ID:5146, and is provided hereinbelow with reference to the sequence listing part.
- [35646] GAM2555 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2555 target RNA, herein designated GAM TARGET RNA. GAM2555 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35647] GAM2555 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2555 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2555 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2555 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2555 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35648] The complementary binding of GAM2555 RNA, herein designated GAM RNA, to target binding sites on GAM2555 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2555 target RNA, herein designated GAM TARGET RNA, into GAM2555 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35649] It is appreciated that GAM2555 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2555 target genes. The mRNA of each one of this plurality of GAM2555 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2555 RNA, herein designated GAM RNA, and which when bound by GAM2555 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2555 target proteins.

[35650] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2555 gene, herein designated GAM GENE, on one or more GAM2555 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35651] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2555 correlate with, and may be deduced from, the identity of the target genes which GAM2555 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35652] Nucleotide sequences of the GAM2555 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2555 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2555 are further described hereinbelow with reference to Table 1.

[35653] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2555 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35654] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2556 (GAM2556) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35655] GAM2556 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2556 was detected is described hereinabove with reference to Figs. 2-8.

[35656] GAM2556 gene, herein designated GAM GENE, and GAM2556 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35657] GAM2556 gene, herein designated GAM GENE, encodes a GAM2556 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2556 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2556 precursor RNA is designated SEQ ID:2533, and is provided hereinbelow with reference to the sequence listing part.

[35658] GAM2556 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35659] An enzyme complex designated DICER COMPLEX, dices the GAM2556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2556 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2556 RNA is designated SEQ ID:5147, and is provided hereinbelow with reference to the sequence listing part.

[35660] GAM2556 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2556 target RNA, herein designated GAM TARGET RNA. GAM2556 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35661] GAM2556 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2556 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2556 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2556 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2556 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35662] The complementary binding of GAM2556 RNA, herein designated GAM RNA, to target binding sites on GAM2556 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2556 target RNA, herein designated GAM TARGET RNA, into GAM2556 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35663] It is appreciated that GAM2556 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2556 target genes. The mRNA of each one of this plurality of GAM2556 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2556 RNA, herein designated GAM RNA, and which when bound by GAM2556 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2556 target proteins.

[35664] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2556 gene, herein designated GAM GENE, on one or more GAM2556 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35665] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2556 correlate with, and may be deduced from, the identity of the target genes which GAM2556 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35666] Nucleotide sequences of the GAM2556 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2556 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2556 are further described hereinbelow with reference to Table 1.

[35667] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2556 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35668] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2557 (GAM2557) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35669] GAM2557 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2557 was detected is described hereinabove with reference to Figs. 2-8.

[35670] GAM2557 gene, herein designated GAM GENE, and GAM2557 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35671] GAM2557 gene, herein designated GAM GENE, encodes a GAM2557 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2557 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2557 precursor RNA is designated SEQ ID:2534, and is provided hereinbelow with reference to the sequence listing part.

[35672] GAM2557 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35673] An enzyme complex designated DICER COMPLEX, dices the GAM2557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2557 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2557 RNA is designated SEQ ID:5148, and is provided hereinbelow with reference to the sequence listing part.

[35674] GAM2557 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2557 target RNA, herein designated GAM TARGET RNA. GAM2557 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35675] GAM2557 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2557 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2557 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2557 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2557 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35676] The complementary binding of GAM2557 RNA, herein designated GAM RNA, to target binding sites on GAM2557 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2557 target RNA, herein designated GAM TARGET RNA, into GAM2557 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35677] It is appreciated that GAM2557 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2557 target genes. The

mRNA of each one of this plurality of GAM2557 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2557 RNA, herein designated GAM RNA, and which when bound by GAM2557 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2557 target proteins.

[35678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2557 gene, herein designated GAM GENE, on one or more GAM2557 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35679] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2557 correlate with, and may be deduced from, the identity of the target genes which GAM2557 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35680] Nucleotide sequences of the GAM2557 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2557 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2557 are further described hereinbelow with reference to Table 1.

[35681] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2557 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35682] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2558 (GAM2558) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35683] GAM2558 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2558 was detected is described hereinabove with reference to Figs. 2-8.

[35684] GAM2558 gene, herein designated GAM GENE, and GAM2558 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35685] GAM2558 gene, herein designated GAM GENE, encodes a GAM2558 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2558 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2558 precursor RNA is designated SEQ ID:2535, and is provided hereinbelow with reference to the sequence listing part.

[35686] GAM2558 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35687] An enzyme complex designated DICER COMPLEX, dices the GAM2558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2558 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2558 RNA is designated SEQ ID:5149, and is provided hereinbelow with reference to the sequence listing part.

[35688] GAM2558 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2558 target RNA, herein designated GAM TARGET RNA. GAM2558 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35689] GAM2558 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2558 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2558 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2558 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2558 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35690] The complementary binding of GAM2558 RNA, herein designated GAM RNA, to target binding sites on GAM2558 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2558 target RNA, herein designated GAM TARGET RNA, into GAM2558 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35691] It is appreciated that GAM2558 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2558 target genes. The mRNA of each one of this plurality of GAM2558 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2558 RNA, herein designated GAM RNA, and which when bound by GAM2558 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2558 target proteins.

[35692] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2558 gene, herein designated GAM GENE, on one or more GAM2558 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35693] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2558 correlate with, and may be deduced from, the identity of the target genes which GAM2558 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35694] Nucleotide sequences of the GAM2558 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2558 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2558 are further described hereinbelow with reference to Table 1.

[35695] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2558 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35696] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2559 (GAM2559) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35697] GAM2559 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2559 was detected is described hereinabove with reference to Figs. 2-8.

[35698] GAM2559 gene, herein designated GAM GENE, and GAM2559 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35699] GAM2559 gene, herein designated GAM GENE, encodes a GAM2559

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2559 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2559 precursor RNA is designated SEQ ID:2536, and is provided hereinbelow with reference to the sequence listing part.

[35700] GAM2559 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35701] An enzyme complex designated DICER COMPLEX, dices the GAM2559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2559 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2559 RNA is designated SEQ ID:5150, and is provided hereinbelow with reference to the sequence listing part.

[35702] GAM2559 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM2559 target RNA, herein designated GAM TARGET RNA. GAM2559 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35703] GAM2559 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2559 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2559 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2559 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2559 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35704] The complementary binding of GAM2559 RNA, herein designated GAM RNA, to target binding sites on GAM2559 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of GAM2559 target RNA, herein designated GAM TARGET RNA, into GAM2559 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35705] It is appreciated that GAM2559 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2559 target genes. The mRNA of each one of this plurality of GAM2559 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2559 RNA, herein designated GAM RNA, and which when bound by GAM2559 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2559 target proteins.

[35706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2559 gene, herein designated GAM GENE, on one or more GAM2559 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35707] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2559 correlate with, and may be deduced from, the identity of the target genes which GAM2559 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35708] Nucleotide sequences of the GAM2559 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2559 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2559 are further described hereinbelow with reference to Table 1.

[35709] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2559 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35710] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2560 (GAM2560) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35711] GAM2560 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2560 was detected is described hereinabove with reference to Figs. 2-8.

[35712] GAM2560 gene, herein designated GAM GENE, and GAM2560 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35713] GAM2560 gene, herein designated GAM GENE, encodes a GAM2560 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2560 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2560 precursor RNA is designated SEQ ID:2537, and is provided hereinbelow with reference to the sequence listing part.

[35714] GAM2560 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35715] An enzyme complex designated DICER COMPLEX, dices the GAM2560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2560 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM2560 RNA is designated SEQ ID:5151, and is provided hereinbelow with reference to the sequence listing part.

[35716] GAM2560 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2560 target RNA, herein designated GAM TARGET RNA. GAM2560 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35717] GAM2560 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2560 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2560 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2560 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2560 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[35718] The complementary binding of GAM2560 RNA, herein designated GAM RNA, to target binding sites on GAM2560 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2560 target RNA, herein designated GAM TARGET RNA, into GAM2560 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35719] It is appreciated that GAM2560 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2560 target genes. The mRNA of each one of this plurality of GAM2560 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2560 RNA, herein designated GAM RNA, and which when bound by GAM2560 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2560 target proteins.

[35720] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2560 gene, herein designated GAM GENE, on one or more GAM2560 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35721] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2560 correlate with, and may be deduced from, the identity of the target genes which GAM2560 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35722] Nucleotide sequences of the GAM2560 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2560 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2560 are further described hereinbelow with reference to Table 1.

[35723] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2560 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35724] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2561 (GAM2561) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [35725] GAM2561 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2561 was detected is described hereinabove with reference to Figs. 2-8.
- [35726] GAM2561 gene, herein designated GAM GENE, and GAM2561 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [35727] GAM2561 gene, herein designated GAM GENE, encodes a GAM2561 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2561 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2561 precursor RNA is designated SEQ ID:2538, and is provided hereinbelow with reference to the sequence listing part.
- [35728] GAM2561 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [35729] An enzyme complex designated DICER COMPLEX, dices the GAM2561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2561 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2561 RNA is designated SEQ ID:5152, and is provided hereinbelow with reference to the sequence listing part.

[35730] GAM2561 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2561 target RNA, herein designated GAM TARGET RNA. GAM2561 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35731] GAM2561 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2561 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2561 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2561 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2561 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35732] The complementary binding of GAM2561 RNA, herein designated GAM RNA, to target binding sites on GAM2561 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2561 target RNA, herein designated GAM TARGET RNA, into GAM2561 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35733] It is appreciated that GAM2561 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2561 target genes. The mRNA of each one of this plurality of GAM2561 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2561 RNA, herein designated GAM RNA, and which when bound by GAM2561 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2561 target proteins.

[35734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2561 gene, herein designated GAM GENE, on one or more GAM2561 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35735] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2561 correlate with, and may be deduced from, the identity of the target genes which GAM2561 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35736] Nucleotide sequences of the GAM2561 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2561 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2561 are further described hereinbelow with reference to Table 1.

[35737] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2561 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35738] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 2562 (GAM2562) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35739] GAM2562 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2562 was detected is described hereinabove with reference to Figs. 2-8.

[35740] GAM2562 gene, herein designated GAM GENE, and GAM2562 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35741] GAM2562 gene, herein designated GAM GENE, encodes a GAM2562 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2562 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2562 precursor RNA is designated SEQ ID:2539, and is provided hereinbelow with reference to the sequence listing part.

[35742] GAM2562 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2562 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35743] An enzyme complex designated DICER COMPLEX, dices the GAM2562 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2562 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2562 RNA is designated SEQ ID:5153, and is provided hereinbelow with reference to the sequence listing part.
- [35744] GAM2562 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2562 target RNA, herein designated GAM TARGET RNA. GAM2562 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35745] GAM2562 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2562 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2562 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2562 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2562 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35746] The complementary binding of GAM2562 RNA, herein designated GAM RNA, to target binding sites on GAM2562 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2562 target RNA, herein designated GAM TARGET RNA, into GAM2562 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35747] It is appreciated that GAM2562 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2562 target genes. The mRNA of each one of this plurality of GAM2562 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2562 RNA, herein designated GAM RNA, and which when bound by GAM2562 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2562 target proteins.

[35748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2562 gene, herein designated GAM GENE, on one or more GAM2562 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35749] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2562 correlate with, and may be deduced from, the identity of the target genes which GAM2562 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35750] Nucleotide sequences of the GAM2562 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2562 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2562 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2562 are further described hereinbelow with reference to Table 1.

[35751] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2562 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35752] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2563 (GAM2563) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35753] GAM2563 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2563 was detected is described hereinabove with reference to Figs. 2-8.

[35754] GAM2563 gene, herein designated GAM GENE, and GAM2563 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35755] GAM2563 gene, herein designated GAM GENE, encodes a GAM2563 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2563 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2563 precursor RNA is designated SEQ ID:2540, and is provided hereinbelow with reference to the sequence listing part.

[35756] GAM2563 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35757] An enzyme complex designated DICER COMPLEX, dices the GAM2563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2563 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2563 RNA is designated SEQ ID:5154, and is provided hereinbelow with reference to the sequence listing part.

[35758] GAM2563 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2563 target RNA, herein designated GAM TARGET RNA. GAM2563 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35759] GAM2563 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2563 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2563 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2563 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2563 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35760] The complementary binding of GAM2563 RNA, herein designated GAM RNA, to target binding sites on GAM2563 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2563 target RNA, herein designated GAM TARGET RNA, into GAM2563 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35761] It is appreciated that GAM2563 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2563 target genes. The mRNA of each one of this plurality of GAM2563 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2563 RNA, herein designated GAM RNA, and which when bound by GAM2563 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2563 target proteins.

[35762] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2563 gene, herein designated GAM GENE, on one or more GAM2563 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35763] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2563 correlate with, and may be deduced from, the identity of the target genes which GAM2563 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35764] Nucleotide sequences of the GAM2563 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2563 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2563 are further described hereinbelow with reference to Table 1.

[35765] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2563 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35766] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2564 (GAM2564) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35767] GAM2564 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2564 was detected is described hereinabove with reference to Figs. 2-8.

[35768] GAM2564 gene, herein designated GAM GENE, and GAM2564 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35769] GAM2564 gene, herein designated GAM GENE, encodes a GAM2564 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2564 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2564 precursor RNA is designated SEQ ID:2541, and is provided hereinbelow with reference to the sequence listing part.

[35770] GAM2564 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35771] An enzyme complex designated DICER COMPLEX, dices the GAM2564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2564 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2564 RNA is designated SEQ ID:5155, and is provided hereinbelow with reference to the sequence listing part.

[35772] GAM2564 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2564 target RNA, herein designated GAM TARGET RNA. GAM2564 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35773] GAM2564 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2564 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2564 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2564 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2564 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35774] The complementary binding of GAM2564 RNA, herein designated GAM RNA, to target binding sites on GAM2564 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2564 target RNA, herein designated GAM TARGET RNA, into GAM2564 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35775] It is appreciated that GAM2564 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2564 target genes. The

mRNA of each one of this plurality of GAM2564 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2564 RNA, herein designated GAM RNA, and which when bound by GAM2564 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2564 target proteins.

[35776] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2564 gene, herein designated GAM GENE, on one or more GAM2564 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35777] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2564 correlate with, and may be deduced from, the identity of the target genes which GAM2564 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35778] Nucleotide sequences of the GAM2564 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2564 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2564 are further described hereinbelow with reference to Table 1.

[35779] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2564 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35780] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2565 (GAM2565) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35781] GAM2565 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2565 was detected is described hereinabove with reference to Figs. 2-8.

[35782] GAM2565 gene, herein designated GAM GENE, and GAM2565 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35783] GAM2565 gene, herein designated GAM GENE, encodes a GAM2565 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2565 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2565 precursor RNA is designated SEQ ID:2542, and is provided hereinbelow with reference to the sequence listing part.

[35784] GAM2565 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35785] An enzyme complex designated DICER COMPLEX, dices the GAM2565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2565 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2565 RNA is designated SEQ ID:5156, and is provided hereinbelow with reference to the sequence listing part.

[35786] GAM2565 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2565 target RNA, herein designated GAM TARGET RNA. GAM2565 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35787] GAM2565 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2565 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2565 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2565 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2565 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35788] The complementary binding of GAM2565 RNA, herein designated GAM RNA, to target binding sites on GAM2565 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2565 target RNA, herein designated GAM TARGET RNA, into GAM2565 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35789] It is appreciated that GAM2565 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2565 target genes. The mRNA of each one of this plurality of GAM2565 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2565 RNA, herein designated GAM RNA, and which when bound by GAM2565 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2565 target proteins.

[35790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2565 gene, herein designated GAM GENE, on one or more GAM2565 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35791] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2565 correlate with, and may be deduced from, the identity of the target

genes which GAM2565 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35792] Nucleotide sequences of the GAM2565 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2565 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2565 are further described hereinbelow with reference to Table 1.

[35793] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2565 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35794] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2566 (GAM2566) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35795] GAM2566 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2566 was detected is described hereinabove with reference to Figs. 2-8.

[35796] GAM2566 gene, herein designated GAM GENE, and GAM2566 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[35797] GAM2566 gene, herein designated GAM GENE, encodes a GAM2566 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2566 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2566 precursor RNA is designated SEQ ID:2543, and is provided hereinbelow with reference to the sequence listing part.

[35798] GAM2566 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35799] An enzyme complex designated DICER COMPLEX, dices the GAM2566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2566 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2566 RNA is designated SEQ ID:5157, and is provided

hereinbelow with reference to the sequence listing part.

[35800] GAM2566 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2566 target RNA, herein designated GAM TARGET RNA. GAM2566 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35801] GAM2566 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2566 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2566 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2566 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2566 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35802] The complementary binding of GAM2566 RNA, herein designated GAM RNA, to target binding sites on GAM2566 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2566 target RNA, herein designated GAM TARGET RNA, into GAM2566 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35803] It is appreciated that GAM2566 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2566 target genes. The mRNA of each one of this plurality of GAM2566 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2566 RNA, herein designated GAM RNA, and which when bound by GAM2566 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2566 target proteins.

[35804] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2566 gene, herein designated GAM GENE, on one or more GAM2566 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35805] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2566 correlate with, and may be deduced from, the identity of the target genes which GAM2566 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35806] Nucleotide sequences of the GAM2566 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2566 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2566 are further described hereinbelow with reference to Table 1.

[35807] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2566 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35808] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2567 (GAM2567) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35809] GAM2567 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2567 was detected is described hereinabove with reference to Figs. 2-8.

[35810] GAM2567 gene, herein designated GAM GENE, and GAM2567 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35811] GAM2567 gene, herein designated GAM GENE, encodes a GAM2567 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2567 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2567 precursor RNA is designated SEQ ID:2544, and is provided hereinbelow with reference to the sequence listing part.

[35812] GAM2567 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35813] An enzyme complex designated DICER COMPLEX, dices the GAM2567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2567 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2567 RNA is designated SEQ ID:5158, and is provided hereinbelow with reference to the sequence listing part.

[35814] GAM2567 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2567 target RNA, herein designated GAM TARGET RNA. GAM2567 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35815] GAM2567 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2567 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2567 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2567 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2567 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35816] The complementary binding of GAM2567 RNA, herein designated GAM RNA, to target binding sites on GAM2567 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2567 target RNA, herein designated GAM TARGET RNA, into GAM2567 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35817] It is appreciated that GAM2567 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2567 target genes. The mRNA of each one of this plurality of GAM2567 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2567 RNA, herein designated GAM RNA, and which when bound by GAM2567 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2567 target proteins.

[35818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2567 gene, herein designated GAM GENE, on one or more GAM2567 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35819] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2567 correlate with, and may be deduced from, the identity of the target genes which GAM2567 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35820] Nucleotide sequences of the GAM2567 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2567 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2567 are further described hereinbelow with reference to Table 1.

[35821] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2567 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35822] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2568 (GAM2568) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35823] GAM2568 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2568 was detected is described hereinabove with reference to Figs. 2-8.

[35824] GAM2568 gene, herein designated GAM GENE, and GAM2568 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35825] GAM2568 gene, herein designated GAM GENE, encodes a GAM2568 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2568 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2568 precursor RNA is designated SEQ ID:2545, and is provided hereinbelow with reference to the sequence listing part.

[35826] GAM2568 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35827] An enzyme complex designated DICER COMPLEX, dices the GAM2568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2568 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2568 RNA is designated SEQ ID:5159, and is provided hereinbelow with reference to the sequence listing part.
- [35828] GAM2568 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2568 target RNA, herein designated GAM TARGET RNA. GAM2568 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35829] GAM2568 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2568 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2568 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2568 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2568 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35830] The complementary binding of GAM2568 RNA, herein designated GAM RNA, to target binding sites on GAM2568 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2568 target RNA, herein designated GAM TARGET RNA, into GAM2568 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35831] It is appreciated that GAM2568 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2568 target genes. The mRNA of each one of this plurality of GAM2568 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2568 RNA, herein designated GAM RNA, and which when bound by GAM2568 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2568 target proteins.

[35832] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2568 gene, herein designated GAM GENE, on one or more GAM2568 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35833] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2568 correlate with, and may be deduced from, the identity of the target genes which GAM2568 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35834] Nucleotide sequences of the GAM2568 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2568 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2568 are further described hereinbelow with reference to Table 1.

[35835] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2568 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35836] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2569 (GAM2569) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35837] GAM2569 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2569 was detected is described hereinabove with reference to Figs. 2-8.

[35838] GAM2569 gene, herein designated GAM GENE, and GAM2569 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35839] GAM2569 gene, herein designated GAM GENE, encodes a GAM2569 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2569 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2569 precursor RNA is designated SEQ ID:2546, and is provided hereinbelow with reference to the sequence listing part.

[35840] GAM2569 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35841] An enzyme complex designated DICER COMPLEX, dices the GAM2569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2569 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2569 RNA is designated SEQ ID:5160, and is provided hereinbelow with reference to the sequence listing part.

[35842] GAM2569 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2569 target RNA, herein designated GAM TARGET RNA. GAM2569 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35843] GAM2569 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2569 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2569 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2569 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2569 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35844] The complementary binding of GAM2569 RNA, herein designated GAM RNA, to target binding sites on GAM2569 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2569 target RNA, herein designated GAM TARGET RNA, into GAM2569 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35845] It is appreciated that GAM2569 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2569 target genes. The mRNA of each one of this plurality of GAM2569 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2569 RNA, herein designated GAM RNA, and which when bound by GAM2569 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2569 target proteins.

[35846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2569 gene, herein designated GAM GENE, on one or more GAM2569 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35847] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2569 correlate with, and may be deduced from, the identity of the target genes which GAM2569 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35848] Nucleotide sequences of the GAM2569 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2569 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2569 are further described hereinbelow with reference to Table 1.

[35849] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2569 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35850] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2570 (GAM2570) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35851] GAM2570 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2570 was detected is described hereinabove with reference to Figs. 2-8.

[35852] GAM2570 gene, herein designated GAM GENE, and GAM2570 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35853] GAM2570 gene, herein designated GAM GENE, encodes a GAM2570 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2570 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2570 precursor RNA is designated SEQ ID:2547, and is provided hereinbelow with reference to the sequence listing part.

[35854] GAM2570 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35855] An enzyme complex designated DICER COMPLEX, dices the GAM2570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2570 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2570 RNA is designated SEQ ID:5161, and is provided hereinbelow with reference to the sequence listing part.

[35856] GAM2570 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2570 target RNA, herein designated GAM TARGET RNA. GAM2570 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35857] GAM2570 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2570 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2570 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2570 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2570 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35858] The complementary binding of GAM2570 RNA, herein designated GAM RNA, to target binding sites on GAM2570 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2570 target RNA, herein designated GAM TARGET RNA, into GAM2570 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35859] It is appreciated that GAM2570 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2570 target genes. The

mRNA of each one of this plurality of GAM2570 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2570 RNA, herein designated GAM RNA, and which when bound by GAM2570 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2570 target proteins.

[35860] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2570 gene, herein designated GAM GENE, on one or more GAM2570 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35861] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2570 correlate with, and may be deduced from, the identity of the target genes which GAM2570 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35862] Nucleotide sequences of the GAM2570 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2570 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2570 are further described hereinbelow with reference to Table 1.

[35863] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2570 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35864] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2571 (GAM2571) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35865] GAM2571 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2571 was detected is described hereinabove with reference to Figs. 2-8.

[35866] GAM2571 gene, herein designated GAM GENE, and GAM2571 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35867] GAM2571 gene, herein designated GAM GENE, encodes a GAM2571 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2571 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2571 precursor RNA is designated SEQ ID:2548, and is provided hereinbelow with reference to the sequence listing part.

[35868] GAM2571 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35869] An enzyme complex designated DICER COMPLEX, dices the GAM2571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2571 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2571 RNA is designated SEQ ID:5162, and is provided hereinbelow with reference to the sequence listing part.

[35870] GAM2571 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2571 target RNA, herein designated GAM TARGET RNA. GAM2571 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35871] GAM2571 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2571 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2571 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2571 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2571 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35872] The complementary binding of GAM2571 RNA, herein designated GAM RNA, to target binding sites on GAM2571 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2571 target RNA, herein designated GAM TARGET RNA, into GAM2571 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35873] It is appreciated that GAM2571 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2571 target genes. The mRNA of each one of this plurality of GAM2571 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2571 RNA, herein designated GAM RNA, and which when bound by GAM2571 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2571 target proteins.

[35874] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2571 gene, herein designated GAM GENE, on one or more GAM2571 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35875] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2571 correlate with, and may be deduced from, the identity of the target

genes which GAM2571 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35876] Nucleotide sequences of the GAM2571 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2571 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2571 are further described hereinbelow with reference to Table 1.

[35877] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2571 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35878] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2572 (GAM2572) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35879] GAM2572 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2572 was detected is described hereinabove with reference to Figs. 2-8.

[35880] GAM2572 gene, herein designated GAM GENE, and GAM2572 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[35881] GAM2572 gene, herein designated GAM GENE, encodes a GAM2572 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2572 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2572 precursor RNA is designated SEQ ID:2549, and is provided hereinbelow with reference to the sequence listing part.

[35882] GAM2572 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35883] An enzyme complex designated DICER COMPLEX, dices the GAM2572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2572 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2572 RNA is designated SEQ ID:5163, and is provided

hereinbelow with reference to the sequence listing part.

[35884] GAM2572 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2572 target RNA, herein designated GAM TARGET RNA. GAM2572 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35885] GAM2572 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2572 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2572 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2572 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2572 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35886] The complementary binding of GAM2572 RNA, herein designated GAM RNA, to target binding sites on GAM2572 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2572 target RNA, herein designated GAM TARGET RNA, into GAM2572 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35887] It is appreciated that GAM2572 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2572 target genes. The mRNA of each one of this plurality of GAM2572 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2572 RNA, herein designated GAM RNA, and which when bound by GAM2572 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2572 target proteins.

[35888] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2572 gene, herein designated GAM GENE, on one or more GAM2572 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35889] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2572 correlate with, and may be deduced from, the identity of the target genes which GAM2572 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35890] Nucleotide sequences of the GAM2572 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2572 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2572 are further described hereinbelow with reference to Table 1.

[35891] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2572 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35892] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2573 (GAM2573) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35893] GAM2573 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2573 was detected is described hereinabove with reference to Figs. 2-8.

[35894] GAM2573 gene, herein designated GAM GENE, and GAM2573 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35895] GAM2573 gene, herein designated GAM GENE, encodes a GAM2573 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2573 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2573 precursor RNA is designated SEQ ID:2550, and is provided hereinbelow with reference to the sequence listing part.

[35896] GAM2573 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35897] An enzyme complex designated DICER COMPLEX, dices the GAM2573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2573 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2573 RNA is designated SEQ ID:5164, and is provided hereinbelow with reference to the sequence listing part.

[35898] GAM2573 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2573 target RNA, herein designated GAM TARGET RNA. GAM2573 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35899] GAM2573 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2573 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2573 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2573 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2573 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35900] The complementary binding of GAM2573 RNA, herein designated GAM RNA, to target binding sites on GAM2573 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2573 target RNA, herein designated GAM TARGET RNA, into GAM2573 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35901] It is appreciated that GAM2573 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2573 target genes. The mRNA of each one of this plurality of GAM2573 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2573 RNA, herein designated GAM RNA, and which when bound by GAM2573 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2573 target proteins.

[35902] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2573 gene, herein designated GAM GENE, on one or more GAM2573 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35903] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2573 correlate with, and may be deduced from, the identity of the target genes which GAM2573 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35904] Nucleotide sequences of the GAM2573 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2573 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2573 are further described hereinbelow with reference to Table 1.

[35905] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2573 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35906] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2574 (GAM2574) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35907] GAM2574 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2574 was detected is described hereinabove with reference to Figs. 2-8.

[35908] GAM2574 gene, herein designated GAM GENE, and GAM2574 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35909] GAM2574 gene, herein designated GAM GENE, encodes a GAM2574 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2574 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2574 precursor RNA is designated SEQ ID:2551, and is provided hereinbelow with reference to the sequence listing part.

[35910] GAM2574 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35911] An enzyme complex designated DICER COMPLEX, dices the GAM2574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2574 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2574 RNA is designated SEQ ID:5165, and is provided hereinbelow with reference to the sequence listing part.
- [35912] GAM2574 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2574 target RNA, herein designated GAM TARGET RNA. GAM2574 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35913] GAM2574 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2574 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2574 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2574 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2574 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35914] The complementary binding of GAM2574 RNA, herein designated GAM RNA, to target binding sites on GAM2574 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2574 target RNA, herein designated GAM TARGET RNA, into GAM2574 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35915] It is appreciated that GAM2574 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2574 target genes. The mRNA of each one of this plurality of GAM2574 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2574 RNA, herein designated GAM RNA, and which when bound by GAM2574 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2574 target proteins.

[35916] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2574 gene, herein designated GAM GENE, on one or more GAM2574 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35917] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2574 correlate with, and may be deduced from, the identity of the target genes which GAM2574 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35918] Nucleotide sequences of the GAM2574 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2574 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2574 are further described hereinbelow with reference to Table 1.

[35919] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2574 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[35920] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2575 (GAM2575) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35921] GAM2575 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2575 was detected is described hereinabove with reference to Figs. 2-8.

[35922] GAM2575 gene, herein designated GAM GENE, and GAM2575 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35923] GAM2575 gene, herein designated GAM GENE, encodes a GAM2575 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2575 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2575 precursor RNA is designated SEQ ID:2552, and is provided hereinbelow with reference to the sequence listing part.

[35924] GAM2575 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35925] An enzyme complex designated DICER COMPLEX, dices the GAM2575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2575 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2575 RNA is designated SEQ ID:5167, and is provided hereinbelow with reference to the sequence listing part.

[35926] GAM2575 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2575 target RNA, herein designated GAM TARGET RNA. GAM2575 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35927] GAM2575 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2575 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2575 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2575 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2575 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35928] The complementary binding of GAM2575 RNA, herein designated GAM RNA, to target binding sites on GAM2575 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2575 target RNA, herein designated GAM TARGET RNA, into GAM2575 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35929] It is appreciated that GAM2575 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2575 target genes. The mRNA of each one of this plurality of GAM2575 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2575 RNA, herein designated GAM RNA, and which when bound by GAM2575 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2575 target proteins.

[35930] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2575 gene, herein designated GAM GENE, on one or more GAM2575 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35931] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2575 correlate with, and may be deduced from, the identity of the target genes which GAM2575 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35932] Nucleotide sequences of the GAM2575 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2575 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2575 are further described hereinbelow with reference to Table 1.

[35933] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2575 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35934] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2576 (GAM2576) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35935] GAM2576 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2576 was detected is described hereinabove with reference to Figs. 2-8.

[35936] GAM2576 gene, herein designated GAM GENE, and GAM2576 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35937] GAM2576 gene, herein designated GAM GENE, encodes a GAM2576 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2576 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2576 precursor RNA is designated SEQ ID:2553, and is provided hereinbelow with reference to the sequence listing part.

[35938] GAM2576 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35939] An enzyme complex designated DICER COMPLEX, dices the GAM2576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2576 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2576 RNA is designated SEQ ID:5166, and is provided hereinbelow with reference to the sequence listing part.

[35940] GAM2576 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2576 target RNA, herein designated GAM TARGET RNA. GAM2576 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35941] GAM2576 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2576 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2576 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2576 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2576 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35942] The complementary binding of GAM2576 RNA, herein designated GAM RNA, to target binding sites on GAM2576 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2576 target RNA, herein designated GAM TARGET RNA, into GAM2576 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35943] It is appreciated that GAM2576 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2576 target genes. The

mRNA of each one of this plurality of GAM2576 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2576 RNA, herein designated GAM RNA, and which when bound by GAM2576 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2576 target proteins.

[35944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2576 gene, herein designated GAM GENE, on one or more GAM2576 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35945] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2576 correlate with, and may be deduced from, the identity of the target genes which GAM2576 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35946] Nucleotide sequences of the GAM2576 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2576 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2576 are further described hereinbelow with reference to Table 1.

[35947] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2576 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35948] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2577 (GAM2577) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35949] GAM2577 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2577 was detected is described hereinabove with reference to Figs. 2-8.

[35950] GAM2577 gene, herein designated GAM GENE, and GAM2577 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35951] GAM2577 gene, herein designated GAM GENE, encodes a GAM2577 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2577 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2577 precursor RNA is designated SEQ ID:2554, and is provided hereinbelow with reference to the sequence listing part.

[35952] GAM2577 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2577 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35953] An enzyme complex designated DICER COMPLEX, dices the GAM2577 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2577 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2577 RNA is designated SEQ ID:5168, and is provided hereinbelow with reference to the sequence listing part.

[35954] GAM2577 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2577 target RNA, herein designated GAM TARGET RNA. GAM2577 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35955] GAM2577 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2577 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2577 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2577 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2577 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35956] The complementary binding of GAM2577 RNA, herein designated GAM RNA, to target binding sites on GAM2577 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2577 target RNA, herein designated GAM TARGET RNA, into GAM2577 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35957] It is appreciated that GAM2577 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2577 target genes. The mRNA of each one of this plurality of GAM2577 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2577 RNA, herein designated GAM RNA, and which when bound by GAM2577 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2577 target proteins.

[35958] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2577 gene, herein designated GAM GENE, on one or more GAM2577 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35959] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2577 correlate with, and may be deduced from, the identity of the target

genes which GAM2577 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35960] Nucleotide sequences of the GAM2577 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2577 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2577 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2577 are further described hereinbelow with reference to Table 1.

[35961] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2577 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35962] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2578 (GAM2578) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35963] GAM2578 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2578 was detected is described hereinabove with reference to Figs. 2-8.

[35964] GAM2578 gene, herein designated GAM GENE, and GAM2578 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[35965] GAM2578 gene, herein designated GAM GENE, encodes a GAM2578 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2578 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2578 precursor RNA is designated SEQ ID:2555, and is provided hereinbelow with reference to the sequence listing part.

[35966] GAM2578 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35967] An enzyme complex designated DICER COMPLEX, dices the GAM2578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2578 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2578 RNA is designated SEQ ID:5169, and is provided

hereinbelow with reference to the sequence listing part.

[35968] GAM2578 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2578 target RNA, herein designated GAM TARGET RNA. GAM2578 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35969] GAM2578 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2578 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2578 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2578 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2578 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35970] The complementary binding of GAM2578 RNA, herein designated GAM RNA, to target binding sites on GAM2578 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2578 target RNA, herein designated GAM TARGET RNA, into GAM2578 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35971] It is appreciated that GAM2578 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2578 target genes. The mRNA of each one of this plurality of GAM2578 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2578 RNA, herein designated GAM RNA, and which when bound by GAM2578 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2578 target proteins.

[35972] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2578 gene, herein designated GAM GENE, on one or more GAM2578 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35973] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2578 correlate with, and may be deduced from, the identity of the target genes which GAM2578 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35974] Nucleotide sequences of the GAM2578 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2578 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2578 are further described hereinbelow with reference to Table 1.

[35975] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2578 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35976] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2579 (GAM2579) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35977] GAM2579 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2579 was detected is described hereinabove with reference to Figs. 2-8.

[35978] GAM2579 gene, herein designated GAM GENE, and GAM2579 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35979] GAM2579 gene, herein designated GAM GENE, encodes a GAM2579 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2579 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2579 precursor RNA is designated SEQ ID:2556, and is provided hereinbelow with reference to the sequence listing part.

[35980] GAM2579 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[35981] An enzyme complex designated DICER COMPLEX, dices the GAM2579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2579 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2579 RNA is designated SEQ ID:5170, and is provided hereinbelow with reference to the sequence listing part.

[35982] GAM2579 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2579 target RNA, herein designated GAM TARGET RNA. GAM2579 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[35983] GAM2579 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2579 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2579 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2579 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2579 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35984] The complementary binding of GAM2579 RNA, herein designated GAM RNA, to target binding sites on GAM2579 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2579 target RNA, herein designated GAM TARGET RNA, into GAM2579 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35985] It is appreciated that GAM2579 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2579 target genes. The mRNA of each one of this plurality of GAM2579 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2579 RNA, herein designated GAM RNA, and which when bound by GAM2579 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2579 target proteins.

[35986] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2579 gene, herein designated GAM GENE, on one or more GAM2579 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[35987] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2579 correlate with, and may be deduced from, the identity of the target genes which GAM2579 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[35988] Nucleotide sequences of the GAM2579 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2579 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2579 are further described hereinbelow with reference to Table 1.

[35989] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2579 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[35990] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2580 (GAM2580) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[35991] GAM2580 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2580 was detected is described hereinabove with reference to Figs. 2-8.

[35992] GAM2580 gene, herein designated GAM GENE, and GAM2580 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[35993] GAM2580 gene, herein designated GAM GENE, encodes a GAM2580 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2580 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2580 precursor RNA is designated SEQ ID:2557, and is provided hereinbelow with reference to the sequence listing part.

[35994] GAM2580 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [35995] An enzyme complex designated DICER COMPLEX, dices the GAM2580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2580 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2580 RNA is designated SEQ ID:5171, and is provided hereinbelow with reference to the sequence listing part.
- [35996] GAM2580 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2580 target RNA, herein designated GAM TARGET RNA. GAM2580 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [35997] GAM2580 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2580 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2580 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2580 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2580 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[35998] The complementary binding of GAM2580 RNA, herein designated GAM RNA, to target binding sites on GAM2580 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2580 target RNA, herein designated GAM TARGET RNA, into GAM2580 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[35999] It is appreciated that GAM2580 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2580 target genes. The mRNA of each one of this plurality of GAM2580 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2580 RNA, herein designated GAM RNA, and which when bound by GAM2580 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2580 target proteins.

[36000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2580 gene, herein designated GAM GENE, on one or more GAM2580 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36001] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2580 correlate with, and may be deduced from, the identity of the target genes which GAM2580 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36002] Nucleotide sequences of the GAM2580 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2580 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2580 are further described hereinbelow with reference to Table 1.

[36003] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2580 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[36004] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2581 (GAM2581) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36005] GAM2581 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2581 was detected is described hereinabove with reference to Figs. 2-8.

[36006] GAM2581 gene, herein designated GAM GENE, and GAM2581 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36007] GAM2581 gene, herein designated GAM GENE, encodes a GAM2581 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2581 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2581 precursor RNA is designated SEQ ID:2558, and is provided hereinbelow with reference to the sequence listing part.

[36008] GAM2581 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36009] An enzyme complex designated DICER COMPLEX, dices the GAM2581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2581 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM2581 RNA is designated SEQ ID:5172, and is provided hereinbelow with reference to the sequence listing part.

[36010] GAM2581 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2581 target RNA, herein designated GAM TARGET RNA. GAM2581 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36011] GAM2581 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2581 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2581 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting. GAM2581 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2581 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36012] The complementary binding of GAM2581 RNA, herein designated GAM RNA, to target binding sites on GAM2581 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2581 target RNA, herein designated GAM TARGET RNA, into GAM2581 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36013] It is appreciated that GAM2581 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2581 target genes. The mRNA of each one of this plurality of GAM2581 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2581 RNA, herein designated GAM RNA, and which when bound by GAM2581 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2581 target proteins.

[36014] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2581 gene, herein designated GAM GENE, on one or more GAM2581 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36015] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2581 correlate with, and may be deduced from, the identity of the target genes which GAM2581 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36016] Nucleotide sequences of the GAM2581 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2581 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2581 are further described hereinbelow with reference to Table 1.

[36017] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2581 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36018] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2582 (GAM2582) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36019] GAM2582 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2582 was detected is described hereinabove with reference to Figs. 2-8.

[36020] GAM2582 gene, herein designated GAM GENE, and GAM2582 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36021] GAM2582 gene, herein designated GAM GENE, encodes a GAM2582 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2582 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2582 precursor RNA is designated SEQ ID:2559, and is provided hereinbelow with reference to the sequence listing part.

[36022] GAM2582 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36023] An enzyme complex designated DICER COMPLEX, dices the GAM2582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2582 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2582 RNA is designated SEQ ID:5173, and is provided hereinbelow with reference to the sequence listing part.

[36024] GAM2582 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2582 target RNA, herein designated GAM TARGET RNA. GAM2582 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36025] GAM2582 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2582 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2582 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2582 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2582 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36026] The complementary binding of GAM2582 RNA, herein designated GAM RNA, to target binding sites on GAM2582 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2582 target RNA, herein designated GAM TARGET RNA, into GAM2582 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36027] It is appreciated that GAM2582 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2582 target genes. The

mRNA of each one of this plurality of GAM2582 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2582 RNA, herein designated GAM RNA, and which when bound by GAM2582 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2582 target proteins.

[36028] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2582 gene, herein designated GAM GENE, on one or more GAM2582 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36029] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2582 correlate with, and may be deduced from, the identity of the target genes which GAM2582 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36030] Nucleotide sequences of the GAM2582 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2582 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2582 are further described hereinbelow with reference to Table 1.

[36031] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2582 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36032] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2583 (GAM2583) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36033] GAM2583 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2583 was detected is described hereinabove with reference to Figs. 2-8.

[36034] GAM2583 gene, herein designated GAM GENE, and GAM2583 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36035] GAM2583 gene, herein designated GAM GENE, encodes a GAM2583 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2583 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2583 precursor RNA is designated SEQ ID:2560, and is provided hereinbelow with reference to the sequence listing part.

[36036] GAM2583 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36037] An enzyme complex designated DICER COMPLEX, dices the GAM2583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2583 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2583 RNA is designated SEQ ID:5174, and is provided hereinbelow with reference to the sequence listing part.

[36038] GAM2583 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2583 target RNA, herein designated GAM TARGET RNA. GAM2583 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36039] GAM2583 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2583 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2583 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2583 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2583 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36040] The complementary binding of GAM2583 RNA, herein designated GAM RNA, to target binding sites on GAM2583 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2583 target RNA, herein designated GAM TARGET RNA, into GAM2583 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36041] It is appreciated that GAM2583 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2583 target genes. The mRNA of each one of this plurality of GAM2583 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2583 RNA, herein designated GAM RNA, and which when bound by GAM2583 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2583 target proteins.

[36042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2583 gene, herein designated GAM GENE, on one or more GAM2583 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36043] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2583 correlate with, and may be deduced from, the identity of the target

genes which GAM2583 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36044] Nucleotide sequences of the GAM2583 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2583 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2583 are further described hereinbelow with reference to Table 1.

[36045] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2583 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36046] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2584 (GAM2584) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36047] GAM2584 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2584 was detected is described hereinabove with reference to Figs. 2-8.

[36048] GAM2584 gene, herein designated GAM GENE, and GAM2584 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[36049] GAM2584 gene, herein designated GAM GENE, encodes a GAM2584 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2584 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2584 precursor RNA is designated SEQ ID:2561, and is provided hereinbelow with reference to the sequence listing part.

[36050] GAM2584 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36051] An enzyme complex designated DICER COMPLEX, dices the GAM2584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2584 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2584 RNA is designated SEQ ID:5175, and is provided

hereinbelow with reference to the sequence listing part.

[36052] GAM2584 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2584 target RNA, herein designated GAM TARGET RNA. GAM2584 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36053] GAM2584 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2584 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2584 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2584 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2584 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36054] The complementary binding of GAM2584 RNA, herein designated GAM RNA, to target binding sites on GAM2584 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2584 target RNA, herein designated GAM TARGET RNA, into GAM2584 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36055] It is appreciated that GAM2584 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2584 target genes. The mRNA of each one of this plurality of GAM2584 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2584 RNA, herein designated GAM RNA, and which when bound by GAM2584 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2584 target proteins.

[36056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2584 gene, herein designated GAM GENE, on one or more GAM2584 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36057] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2584 correlate with, and may be deduced from, the identity of the target genes which GAM2584 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36058] Nucleotide sequences of the GAM2584 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2584 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2584 are further described hereinbelow with reference to Table 1.

[36059] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2584 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36060] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2585 (GAM2585) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36061] GAM2585 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2585 was detected is described hereinabove with reference to Figs. 2-8.

[36062] GAM2585 gene, herein designated GAM GENE, and GAM2585 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36063] GAM2585 gene, herein designated GAM GENE, encodes a GAM2585 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2585 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2585 precursor RNA is designated SEQ ID:2562, and is provided hereinbelow with reference to the sequence listing part.

[36064] GAM2585 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36065] An enzyme complex designated DICER COMPLEX, dices the GAM2585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2585 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2585 RNA is designated SEQ ID:5176, and is provided hereinbelow with reference to the sequence listing part.

[36066] GAM2585 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2585 target RNA, herein designated GAM TARGET RNA. GAM2585 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36067] GAM2585 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2585 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2585 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2585 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2585 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36068] The complementary binding of GAM2585 RNA, herein designated GAM RNA, to target binding sites on GAM2585 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2585 target RNA, herein designated GAM TARGET RNA, into GAM2585 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36069] It is appreciated that GAM2585 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2585 target genes. The mRNA of each one of this plurality of GAM2585 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2585 RNA, herein designated GAM RNA, and which when bound by GAM2585 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2585 target proteins.

[36070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2585 gene, herein designated GAM GENE, on one or more GAM2585 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36071] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2585 correlate with, and may be deduced from, the identity of the target genes which GAM2585 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36072] Nucleotide sequences of the GAM2585 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2585 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2585 are further described hereinbelow with reference to Table 1.

[36073] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2585 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36074] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2586 (GAM2586) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36075] GAM2586 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2586 was detected is described hereinabove with reference to Figs. 2-8.

[36076] GAM2586 gene, herein designated GAM GENE, and GAM2586 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36077] GAM2586 gene, herein designated GAM GENE, encodes a GAM2586 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2586 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2586 precursor RNA is designated SEQ ID:2563, and is provided hereinbelow with reference to the sequence listing part.

[36078] GAM2586 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36079] An enzyme complex designated DICER COMPLEX, dices the GAM2586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2586 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2586 RNA is designated SEQ ID:5179, and is provided hereinbelow with reference to the sequence listing part.

[36080] GAM2586 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2586 target RNA, herein designated GAM TARGET RNA. GAM2586 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36081] GAM2586 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2586 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2586 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2586 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2586 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36082] The complementary binding of GAM2586 RNA, herein designated GAM RNA, to target binding sites on GAM2586 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2586 target RNA, herein designated GAM TARGET RNA, into GAM2586 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36083] It is appreciated that GAM2586 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2586 target genes. The mRNA of each one of this plurality of GAM2586 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2586 RNA, herein designated GAM RNA, and which when bound by GAM2586 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2586 target proteins.

[36084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2586 gene, herein designated GAM GENE, on one or more GAM2586 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36085] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2586 correlate with, and may be deduced from, the identity of the target genes which GAM2586 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36086] Nucleotide sequences of the GAM2586 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2586 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2586 are further described hereinbelow with reference to Table 1.

[36087] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2586 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[36088] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2587 (GAM2587) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36089] GAM2587 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2587 was detected is described hereinabove with reference to Figs. 2-8.

[36090] GAM2587 gene, herein designated GAM GENE, and GAM2587 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36091] GAM2587 gene, herein designated GAM GENE, encodes a GAM2587 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2587 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2587 precursor RNA is designated SEQ ID:2564, and is provided hereinbelow with reference to the sequence listing part.

[36092] GAM2587 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36093] An enzyme complex designated DICER COMPLEX, dices the GAM2587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2587 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2587 RNA is designated SEQ ID:5177, and is provided hereinbelow with reference to the sequence listing part.

[36094] GAM2587 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2587 target RNA, herein designated GAM TARGET RNA. GAM2587 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36095] GAM2587 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2587 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2587 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2587 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2587 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36096] The complementary binding of GAM2587 RNA, herein designated GAM RNA, to target binding sites on GAM2587 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2587 target RNA, herein designated GAM TARGET RNA, into GAM2587 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36097] It is appreciated that GAM2587 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2587 target genes. The mRNA of each one of this plurality of GAM2587 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2587 RNA, herein designated GAM RNA, and which when bound by GAM2587 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2587 target proteins.

[36098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2587 gene, herein designated GAM GENE, on one or more GAM2587 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36099] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2587 correlate with, and may be deduced from, the identity of the target genes which GAM2587 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36100] Nucleotide sequences of the GAM2587 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2587 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2587 are further described hereinbelow with reference to Table 1.

- [36101] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2587 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [36102] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2588 (GAM2588) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [36103] GAM2588 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2588 was detected is described hereinabove with reference to Figs. 2-8.
- [36104] GAM2588 gene, herein designated GAM GENE, and GAM2588 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36105] GAM2588 gene, herein designated GAM GENE, encodes a GAM2588 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2588 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2588 precursor RNA is designated SEQ ID:2565, and is provided hereinbelow with reference to the sequence listing part.

[36106] GAM2588 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36107] An enzyme complex designated DICER COMPLEX, dices the GAM2588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2588 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2588 RNA is designated SEQ ID:5178, and is provided hereinbelow with reference to the sequence listing part.

[36108] GAM2588 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2588 target RNA, herein designated GAM TARGET RNA. GAM2588 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36109] GAM2588 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2588 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2588 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2588 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2588 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36110] The complementary binding of GAM2588 RNA, herein designated GAM RNA, to target binding sites on GAM2588 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2588 target RNA, herein designated GAM TARGET RNA, into GAM2588 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36111] It is appreciated that GAM2588 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2588 target genes. The

mRNA of each one of this plurality of GAM2588 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2588 RNA, herein designated GAM RNA, and which when bound by GAM2588 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2588 target proteins.

[36112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2588 gene, herein designated GAM GENE, on one or more GAM2588 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36113] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2588 correlate with, and may be deduced from, the identity of the target genes which GAM2588 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36114] Nucleotide sequences of the GAM2588 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2588 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2588 are further described hereinbelow with reference to Table 1.

[36115] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2588 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36116] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2589 (GAM2589) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36117] GAM2589 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2589 was detected is described hereinabove with reference to Figs. 2-8.

[36118] GAM2589 gene, herein designated GAM GENE, and GAM2589 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36119] GAM2589 gene, herein designated GAM GENE, encodes a GAM2589 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2589 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2589 precursor RNA is designated SEQ ID:2566, and is provided hereinbelow with reference to the sequence listing part.

[36120] GAM2589 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36121] An enzyme complex designated DICER COMPLEX, dices the GAM2589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2589 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2589 RNA is designated SEQ ID:5180, and is provided hereinbelow with reference to the sequence listing part.

[36122] GAM2589 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2589 target RNA, herein designated GAM TARGET RNA. GAM2589 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36123] GAM2589 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2589 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2589 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2589 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2589 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36124] The complementary binding of GAM2589 RNA, herein designated GAM RNA, to target binding sites on GAM2589 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2589 target RNA, herein designated GAM TARGET RNA, into GAM2589 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36125] It is appreciated that GAM2589 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2589 target genes. The mRNA of each one of this plurality of GAM2589 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2589 RNA, herein designated GAM RNA, and which when bound by GAM2589 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2589 target proteins.

[36126] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2589 gene, herein designated GAM GENE, on one or more GAM2589 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36127] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2589 correlate with, and may be deduced from, the identity of the target

genes which GAM2589 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36128] Nucleotide sequences of the GAM2589 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2589 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2589 are further described hereinbelow with reference to Table 1.

[36129] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2589 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36130] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2590 (GAM2590) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36131] GAM2590 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2590 was detected is described hereinabove with reference to Figs. 2-8.

[36132] GAM2590 gene, herein designated GAM GENE, and GAM2590 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[36133] GAM2590 gene, herein designated GAM GENE, encodes a GAM2590 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2590 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2590 precursor RNA is designated SEQ ID:2567, and is provided hereinbelow with reference to the sequence listing part.

[36134] GAM2590 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36135] An enzyme complex designated DICER COMPLEX, dices the GAM2590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2590 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2590 RNA is designated SEQ ID:5181, and is provided

hereinbelow with reference to the sequence listing part.

[36136] GAM2590 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2590 target RNA, herein designated GAM TARGET RNA. GAM2590 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36137] GAM2590 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2590 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2590 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2590 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2590 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36138] The complementary binding of GAM2590 RNA, herein designated GAM RNA, to target binding sites on GAM2590 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2590 target RNA, herein designated GAM TARGET RNA, into GAM2590 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36139] It is appreciated that GAM2590 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2590 target genes. The mRNA of each one of this plurality of GAM2590 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2590 RNA, herein designated GAM RNA, and which when bound by GAM2590 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2590 target proteins.

[36140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2590 gene, herein designated GAM GENE, on one or more GAM2590 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36141] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2590 correlate with, and may be deduced from, the identity of the target genes which GAM2590 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36142] Nucleotide sequences of the GAM2590 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2590 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2590 are further described hereinbelow with reference to Table 1.

[36143] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2590 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36144] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2591 (GAM2591) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36145] GAM2591 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2591 was detected is described hereinabove with reference to Figs. 2-8.

[36146] GAM2591 gene, herein designated GAM GENE, and GAM2591 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36147] GAM2591 gene, herein designated GAM GENE, encodes a GAM2591 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2591 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2591 precursor RNA is designated SEQ ID:2568, and is provided hereinbelow with reference to the sequence listing part.

[36148] GAM2591 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36149] An enzyme complex designated DICER COMPLEX, dices the GAM2591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2591 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2591 RNA is designated SEQ ID:5182, and is provided hereinbelow with reference to the sequence listing part.

[36150] GAM2591 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2591 target RNA, herein designated GAM TARGET RNA. GAM2591 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36151] GAM2591 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2591 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2591 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2591 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2591 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36152] The complementary binding of GAM2591 RNA, herein designated GAM RNA, to target binding sites on GAM2591 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2591 target RNA, herein designated GAM TARGET RNA, into GAM2591 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36153] It is appreciated that GAM2591 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2591 target genes. The mRNA of each one of this plurality of GAM2591 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2591 RNA, herein designated GAM RNA, and which when bound by GAM2591 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2591 target proteins.

[36154] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2591 gene, herein designated GAM GENE, on one or more GAM2591 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36155] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2591 correlate with, and may be deduced from, the identity of the target genes which GAM2591 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36156] Nucleotide sequences of the GAM2591 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2591 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2591 are further described hereinbelow with reference to Table 1.

[36157] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2591 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36158] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2592 (GAM2592) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [36159] GAM2592 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2592 was detected is described hereinabove with reference to Figs. 2-8.
- [36160] GAM2592 gene, herein designated GAM GENE, and GAM2592 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36161] GAM2592 gene, herein designated GAM GENE, encodes a GAM2592 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2592 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2592 precursor RNA is designated SEQ ID:2569, and is provided hereinbelow with reference to the sequence listing part.
- [36162] GAM2592 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [36163] An enzyme complex designated DICER COMPLEX, dices the GAM2592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2592 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2592 RNA is designated SEQ ID:5183, and is provided hereinbelow with reference to the sequence listing part.
- [36164] GAM2592 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2592 target RNA, herein designated GAM TARGET RNA. GAM2592 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [36165] GAM2592 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2592 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2592 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2592 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2592 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36166] The complementary binding of GAM2592 RNA, herein designated GAM RNA, to target binding sites on GAM2592 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2592 target RNA, herein designated GAM TARGET RNA, into GAM2592 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36167] It is appreciated that GAM2592 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2592 target genes. The mRNA of each one of this plurality of GAM2592 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2592 RNA, herein designated GAM RNA, and which when bound by GAM2592 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2592 target proteins.

[36168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2592 gene, herein designated GAM GENE, on one or more GAM2592 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36169] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2592 correlate with, and may be deduced from, the identity of the target genes which GAM2592 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36170] Nucleotide sequences of the GAM2592 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2592 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2592 are further described hereinbelow with reference to Table 1.

[36171] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2592 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[36172] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2593 (GAM2593) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36173] GAM2593 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2593 was detected is described hereinabove with reference to Figs. 2-8.

[36174] GAM2593 gene, herein designated GAM GENE, and GAM2593 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36175] GAM2593 gene, herein designated GAM GENE, encodes a GAM2593 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2593 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2593 precursor RNA is designated SEQ ID:2570, and is provided hereinbelow with reference to the sequence listing part.

[36176] GAM2593 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36177] An enzyme complex designated DICER COMPLEX, dices the GAM2593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2593 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2593 RNA is designated SEQ ID:5184, and is provided hereinbelow with reference to the sequence listing part.

[36178] GAM2593 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2593 target RNA, herein designated GAM TARGET RNA. GAM2593 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36179] GAM2593 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2593 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2593 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2593 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2593 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36180] The complementary binding of GAM2593 RNA, herein designated GAM RNA, to target binding sites on GAM2593 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2593 target RNA, herein designated GAM TARGET RNA, into GAM2593 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36181] It is appreciated that GAM2593 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2593 target genes. The mRNA of each one of this plurality of GAM2593 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2593 RNA, herein designated GAM RNA, and which when bound by GAM2593 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2593 target proteins.

[36182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2593 gene, herein designated GAM GENE, on one or more GAM2593 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36183] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2593 correlate with, and may be deduced from, the identity of the target genes which GAM2593 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36184] Nucleotide sequences of the GAM2593 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2593 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2593 are further described hereinbelow with reference to Table 1.

- [36185] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2593 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [36186] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2594 (GAM2594) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [36187] GAM2594 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2594 was detected is described hereinabove with reference to Figs. 2-8.
- [36188] GAM2594 gene, herein designated GAM GENE, and GAM2594 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36189] GAM2594 gene, herein designated GAM GENE, encodes a GAM2594 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2594 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2594 precursor RNA is designated SEQ ID:2571, and is provided hereinbelow with reference to the sequence listing part.

[36190] GAM2594 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36191] An enzyme complex designated DICER COMPLEX, dices the GAM2594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2594 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2594 RNA is designated SEQ ID:5185, and is provided hereinbelow with reference to the sequence listing part.

[36192] GAM2594 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2594 target RNA, herein designated GAM TARGET RNA. GAM2594 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36193] GAM2594 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2594 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2594 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2594 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2594 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36194] The complementary binding of GAM2594 RNA, herein designated GAM RNA, to target binding sites on GAM2594 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2594 target RNA, herein designated GAM TARGET RNA, into GAM2594 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36195] It is appreciated that GAM2594 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2594 target genes. The

mRNA of each one of this plurality of GAM2594 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2594 RNA, herein designated GAM RNA, and which when bound by GAM2594 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2594 target proteins.

[36196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2594 gene, herein designated GAM GENE, on one or more GAM2594 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36197] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2594 correlate with, and may be deduced from, the identity of the target genes which GAM2594 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36198] Nucleotide sequences of the GAM2594 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2594 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2594 are further described hereinbelow with reference to Table 1.

[36199] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2594 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36200] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2595 (GAM2595) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36201] GAM2595 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2595 was detected is described hereinabove with reference to Figs. 2-8.

[36202] GAM2595 gene, herein designated GAM GENE, and GAM2595 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36203] GAM2595 gene, herein designated GAM GENE, encodes a GAM2595 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2595 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2595 precursor RNA is designated SEQ ID:2572, and is provided hereinbelow with reference to the sequence listing part.

[36204] GAM2595 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36205] An enzyme complex designated DICER COMPLEX, dices the GAM2595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2595 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2595 RNA is designated SEQ ID:5186, and is provided hereinbelow with reference to the sequence listing part.

[36206] GAM2595 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2595 target RNA, herein designated GAM TARGET RNA. GAM2595 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36207] GAM2595 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2595 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2595 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2595 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2595 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36208] The complementary binding of GAM2595 RNA, herein designated GAM RNA, to target binding sites on GAM2595 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2595 target RNA, herein designated GAM TARGET RNA, into GAM2595 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36209] It is appreciated that GAM2595 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2595 target genes. The mRNA of each one of this plurality of GAM2595 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2595 RNA, herein designated GAM RNA, and which when bound by GAM2595 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2595 target proteins.

[36210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2595 gene, herein designated GAM GENE, on one or more GAM2595 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36211] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2595 correlate with, and may be deduced from, the identity of the target

genes which GAM2595 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36212] Nucleotide sequences of the GAM2595 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2595 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2595 are further described hereinbelow with reference to Table 1.

[36213] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2595 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36214] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2596 (GAM2596) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36215] GAM2596 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2596 was detected is described hereinabove with reference to Figs. 2-8.

[36216] GAM2596 gene, herein designated GAM GENE, and GAM2596 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[36217] GAM2596 gene, herein designated GAM GENE, encodes a GAM2596 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2596 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2596 precursor RNA is designated SEQ ID:2573, and is provided hereinbelow with reference to the sequence listing part.

[36218] GAM2596 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2596 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36219] An enzyme complex designated DICER COMPLEX, dices the GAM2596 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2596 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2596 RNA is designated SEQ ID:5187, and is provided

hereinbelow with reference to the sequence listing part.

[36220] GAM2596 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2596 target RNA, herein designated GAM TARGET RNA. GAM2596 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36221] GAM2596 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2596 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2596 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2596 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2596 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36222] The complementary binding of GAM2596 RNA, herein designated GAM RNA, to target binding sites on GAM2596 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2596 target RNA, herein designated GAM TARGET RNA, into GAM2596 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36223] It is appreciated that GAM2596 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2596 target genes. The mRNA of each one of this plurality of GAM2596 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2596 RNA, herein designated GAM RNA, and which when bound by GAM2596 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2596 target proteins.

[36224] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2596 gene, herein designated GAM GENE, on one or more GAM2596 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36225] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2596 correlate with, and may be deduced from, the identity of the target genes which GAM2596 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36226] Nucleotide sequences of the GAM2596 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2596 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2596 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2596 are further described hereinbelow with reference to Table 1.

[36227] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2596 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36228] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2597 (GAM2597) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36229] GAM2597 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2597 was detected is described hereinabove with reference to Figs. 2-8.

[36230] GAM2597 gene, herein designated GAM GENE, and GAM2597 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36231] GAM2597 gene, herein designated GAM GENE, encodes a GAM2597 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2597 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2597 precursor RNA is designated SEQ ID:2574, and is provided hereinbelow with reference to the sequence listing part.

[36232] GAM2597 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36233] An enzyme complex designated DICER COMPLEX, dices the GAM2597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2597 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2597 RNA is designated SEQ ID:5188, and is provided hereinbelow with reference to the sequence listing part.

[36234] GAM2597 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2597 target RNA, herein designated GAM TARGET RNA. GAM2597 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36235] GAM2597 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2597 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2597 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2597 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2597 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36236] The complementary binding of GAM2597 RNA, herein designated GAM RNA, to target binding sites on GAM2597 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2597 target RNA, herein designated GAM TARGET RNA, into GAM2597 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36237] It is appreciated that GAM2597 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2597 target genes. The mRNA of each one of this plurality of GAM2597 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2597 RNA, herein designated GAM RNA, and which when bound by GAM2597 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2597 target proteins.

[36238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2597 gene, herein designated GAM GENE, on one or more GAM2597 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36239] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2597 correlate with, and may be deduced from, the identity of the target genes which GAM2597 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36240] Nucleotide sequences of the GAM2597 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2597 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2597 are further described hereinbelow with reference to Table 1.

[36241] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2597 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36242] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2598 (GAM2598) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36243] GAM2598 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2598 was detected is described hereinabove with reference to Figs. 2-8.

[36244] GAM2598 gene, herein designated GAM GENE, and GAM2598 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36245] GAM2598 gene, herein designated GAM GENE, encodes a GAM2598 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2598 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2598 precursor RNA is designated SEQ ID:2575, and is provided hereinbelow with reference to the sequence listing part.

[36246] GAM2598 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [36247] An enzyme complex designated DICER COMPLEX, dices the GAM2598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2598 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2598 RNA is designated SEQ ID:5189, and is provided hereinbelow with reference to the sequence listing part.
- [36248] GAM2598 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2598 target RNA, herein designated GAM TARGET RNA. GAM2598 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [36249] GAM2598 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2598 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2598 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2598 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2598 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36250] The complementary binding of GAM2598 RNA, herein designated GAM RNA, to target binding sites on GAM2598 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2598 target RNA, herein designated GAM TARGET RNA, into GAM2598 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36251] It is appreciated that GAM2598 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2598 target genes. The mRNA of each one of this plurality of GAM2598 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2598 RNA, herein designated GAM RNA, and which when bound by GAM2598 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2598 target proteins.

[36252] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2598 gene, herein designated GAM GENE, on one or more GAM2598 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36253] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2598 correlate with, and may be deduced from, the identity of the target genes which GAM2598 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36254] Nucleotide sequences of the GAM2598 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2598 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2598 are further described hereinbelow with reference to Table 1.

[36255] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2598 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[36256] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2599 (GAM2599) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36257] GAM2599 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2599 was detected is described hereinabove with reference to Figs. 2-8.

[36258] GAM2599 gene, herein designated GAM GENE, and GAM2599 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36259] GAM2599 gene, herein designated GAM GENE, encodes a GAM2599 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2599 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2599 precursor RNA is designated SEQ ID:2576, and is provided hereinbelow with reference to the sequence listing part.

[36260] GAM2599 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36261] An enzyme complex designated DICER COMPLEX, dices the GAM2599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2599 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2599 RNA is designated SEQ ID:5190, and is provided hereinbelow with reference to the sequence listing part.

[36262] GAM2599 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2599 target RNA, herein designated GAM TARGET RNA. GAM2599 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36263] GAM2599 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2599 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2599 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2599 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2599 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36264] The complementary binding of GAM2599 RNA, herein designated GAM RNA, to target binding sites on GAM2599 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2599 target RNA, herein designated GAM TARGET RNA, into GAM2599 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36265] It is appreciated that GAM2599 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2599 target genes. The mRNA of each one of this plurality of GAM2599 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2599 RNA, herein designated GAM RNA, and which when bound by GAM2599 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2599 target proteins.

[36266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2599 gene, herein designated GAM GENE, on one or more GAM2599 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36267] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2599 correlate with, and may be deduced from, the identity of the target genes which GAM2599 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36268] Nucleotide sequences of the GAM2599 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2599 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2599 are further described hereinbelow with reference to Table 1.

[36269] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2599 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36270] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2600 (GAM2600) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36271] GAM2600 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2600 was detected is described hereinabove with reference to Figs. 2-8.

[36272] GAM2600 gene, herein designated GAM GENE, and GAM2600 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36273] GAM2600 gene, herein designated GAM GENE, encodes a GAM2600 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2600 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2600 precursor RNA is designated SEQ ID:2577, and is provided hereinbelow with reference to the sequence listing part.

[36274] GAM2600 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36275] An enzyme complex designated DICER COMPLEX, dices the GAM2600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2600 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2600 RNA is designated SEQ ID:5191, and is provided hereinbelow with reference to the sequence listing part.

[36276] GAM2600 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2600 target RNA, herein designated GAM TARGET RNA. GAM2600 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36277] GAM2600 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2600 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2600 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2600 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2600 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36278] The complementary binding of GAM2600 RNA, herein designated GAM RNA, to target binding sites on GAM2600 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2600 target RNA, herein designated GAM TARGET RNA, into GAM2600 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36279] It is appreciated that GAM2600 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2600 target genes. The

mRNA of each one of this plurality of GAM2600 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2600 RNA, herein designated GAM RNA, and which when bound by GAM2600 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2600 target proteins.

[36280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2600 gene, herein designated GAM GENE, on one or more GAM2600 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36281] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2600 correlate with, and may be deduced from, the identity of the target genes which GAM2600 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36282] Nucleotide sequences of the GAM2600 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2600 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2600 are further described hereinbelow with reference to Table 1.

[36283] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2600 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36284] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2601 (GAM2601) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36285] GAM2601 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2601 was detected is described hereinabove with reference to Figs. 2-8.

[36286] GAM2601 gene, herein designated GAM GENE, and GAM2601 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36287] GAM2601 gene, herein designated GAM GENE, encodes a GAM2601 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2601 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2601 precursor RNA is designated SEQ ID:2578, and is provided hereinbelow with reference to the sequence listing part.

[36288] GAM2601 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36289] An enzyme complex designated DICER COMPLEX, dices the GAM2601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2601 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2601 RNA is designated SEQ ID:5192, and is provided hereinbelow with reference to the sequence listing part.

[36290] GAM2601 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2601 target RNA, herein designated GAM TARGET RNA. GAM2601 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36291] GAM2601 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2601 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2601 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2601 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2601 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36292] The complementary binding of GAM2601 RNA, herein designated GAM RNA, to target binding sites on GAM2601 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2601 target RNA, herein designated GAM TARGET RNA, into GAM2601 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36293] It is appreciated that GAM2601 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2601 target genes. The mRNA of each one of this plurality of GAM2601 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2601 RNA, herein designated GAM RNA, and which when bound by GAM2601 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2601 target proteins.

[36294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2601 gene, herein designated GAM GENE, on one or more GAM2601 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36295] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2601 correlate with, and may be deduced from, the identity of the target

genes which GAM2601 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36296] Nucleotide sequences of the GAM2601 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2601 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2601 are further described hereinbelow with reference to Table 1.

[36297] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2601 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36298] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2602 (GAM2602) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36299] GAM2602 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2602 was detected is described hereinabove with reference to Figs. 2-8.

[36300] GAM2602 gene, herein designated GAM GENE, and GAM2602 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[36301] GAM2602 gene, herein designated GAM GENE, encodes a GAM2602 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2602 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2602 precursor RNA is designated SEQ ID:2579, and is provided hereinbelow with reference to the sequence listing part.

[36302] GAM2602 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36303] An enzyme complex designated DICER COMPLEX, dices the GAM2602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2602 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2602 RNA is designated SEQ ID:5193, and is provided

hereinbelow with reference to the sequence listing part.

[36304] GAM2602 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2602 target RNA, herein designated GAM TARGET RNA. GAM2602 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36305] GAM2602 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2602 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2602 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2602 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2602 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36306] The complementary binding of GAM2602 RNA, herein designated GAM RNA, to target binding sites on GAM2602 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2602 target RNA, herein designated GAM TARGET RNA, into GAM2602 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36307] It is appreciated that GAM2602 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2602 target genes. The mRNA of each one of this plurality of GAM2602 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2602 RNA, herein designated GAM RNA, and which when bound by GAM2602 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2602 target proteins.

[36308] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2602 gene, herein designated GAM GENE, on one or more GAM2602 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36309] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2602 correlate with, and may be deduced from, the identity of the target genes which GAM2602 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36310] Nucleotide sequences of the GAM2602 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2602 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2602 are further described hereinbelow with reference to Table 1.

[36311] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2602 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36312] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2603 (GAM2603) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36313] GAM2603 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2603 was detected is described hereinabove with reference to Figs. 2-8.

[36314] GAM2603 gene, herein designated GAM GENE, and GAM2603 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36315] GAM2603 gene, herein designated GAM GENE, encodes a GAM2603 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2603 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2603 precursor RNA is designated SEQ ID:2580, and is provided hereinbelow with reference to the sequence listing part.

[36316] GAM2603 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2603 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36317] An enzyme complex designated DICER COMPLEX, dices the GAM2603 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2603 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2603 RNA is designated SEQ ID:5194, and is provided hereinbelow with reference to the sequence listing part.

[36318] GAM2603 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2603 target RNA, herein designated GAM TARGET RNA. GAM2603 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36319] GAM2603 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2603 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2603 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2603 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2603 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36320] The complementary binding of GAM2603 RNA, herein designated GAM RNA, to target binding sites on GAM2603 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2603 target RNA, herein designated GAM TARGET RNA, into GAM2603 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36321] It is appreciated that GAM2603 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2603 target genes. The mRNA of each one of this plurality of GAM2603 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2603 RNA, herein designated GAM RNA, and which when bound by GAM2603 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2603 target proteins.

[36322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2603 gene, herein designated GAM GENE, on one or more GAM2603 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36323] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2603 correlate with, and may be deduced from, the identity of the target genes which GAM2603 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36324] Nucleotide sequences of the GAM2603 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2603 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2603 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2603 are further described hereinbelow with reference to Table 1.

[36325] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2603 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36326] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2604 (GAM2604) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [36327] GAM2604 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2604 was detected is described hereinabove with reference to Figs. 2-8.
- [36328] GAM2604 gene, herein designated GAM GENE, and GAM2604 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36329] GAM2604 gene, herein designated GAM GENE, encodes a GAM2604 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2604 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2604 precursor RNA is designated SEQ ID:2581, and is provided hereinbelow with reference to the sequence listing part.
- [36330] GAM2604 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [36331] An enzyme complex designated DICER COMPLEX, dices the GAM2604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2604 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2604 RNA is designated SEQ ID:5195, and is provided hereinbelow with reference to the sequence listing part.
- [36332] GAM2604 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2604 target RNA, herein designated GAM TARGET RNA. GAM2604 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [36333] GAM2604 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2604 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2604 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2604 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2604 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36334] The complementary binding of GAM2604 RNA, herein designated GAM RNA, to target binding sites on GAM2604 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2604 target RNA, herein designated GAM TARGET RNA, into GAM2604 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36335] It is appreciated that GAM2604 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2604 target genes. The mRNA of each one of this plurality of GAM2604 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2604 RNA, herein designated GAM RNA, and which when bound by GAM2604 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2604 target proteins.

[36336] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2604 gene, herein designated GAM GENE, on one or more GAM2604 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36337] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2604 correlate with, and may be deduced from, the identity of the target genes which GAM2604 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36338] Nucleotide sequences of the GAM2604 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2604 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2604 are further described hereinbelow with reference to Table 1.

[36339] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2604 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[36340] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2605 (GAM2605) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36341] GAM2605 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2605 was detected is described hereinabove with reference to Figs. 2-8.

[36342] GAM2605 gene, herein designated GAM GENE, and GAM2605 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36343] GAM2605 gene, herein designated GAM GENE, encodes a GAM2605 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2605 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2605 precursor RNA is designated SEQ ID:2582, and is provided hereinbelow with reference to the sequence listing part.

[36344] GAM2605 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36345] An enzyme complex designated DICER COMPLEX, dices the GAM2605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2605 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2605 RNA is designated SEQ ID:5196, and is provided hereinbelow with reference to the sequence listing part.

[36346] GAM2605 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2605 target RNA, herein designated GAM TARGET RNA. GAM2605 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36347] GAM2605 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2605 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2605 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2605 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2605 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36348] The complementary binding of GAM2605 RNA, herein designated GAM RNA, to target binding sites on GAM2605 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2605 target RNA, herein designated GAM TARGET RNA, into GAM2605 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36349] It is appreciated that GAM2605 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2605 target genes. The mRNA of each one of this plurality of GAM2605 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2605 RNA, herein designated GAM RNA, and which when bound by GAM2605 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2605 target proteins.

[36350] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2605 gene, herein designated GAM GENE, on one or more GAM2605 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36351] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2605 correlate with, and may be deduced from, the identity of the target genes which GAM2605 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36352] Nucleotide sequences of the GAM2605 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2605 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2605 are further described hereinbelow with reference to Table 1.

[36353] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2605 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36354] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2606 (GAM2606) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36355] GAM2606 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2606 was detected is described hereinabove with reference to Figs. 2-8.

[36356] GAM2606 gene, herein designated GAM GENE, and GAM2606 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36357] GAM2606 gene, herein designated GAM GENE, encodes a GAM2606 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2606 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2606 precursor RNA is designated SEQ ID:2583, and is provided hereinbelow with reference to the sequence listing part.

[36358] GAM2606 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36359] An enzyme complex designated DICER COMPLEX, dices the GAM2606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2606 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2606 RNA is designated SEQ ID:5197, and is provided hereinbelow with reference to the sequence listing part.

[36360] GAM2606 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2606 target RNA, herein designated GAM TARGET RNA. GAM2606 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36361] GAM2606 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2606 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2606 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2606 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2606 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36362] The complementary binding of GAM2606 RNA, herein designated GAM RNA, to target binding sites on GAM2606 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2606 target RNA, herein designated GAM TARGET RNA, into GAM2606 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36363] It is appreciated that GAM2606 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2606 target genes. The

mRNA of each one of this plurality of GAM2606 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2606 RNA, herein designated GAM RNA, and which when bound by GAM2606 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2606 target proteins.

[36364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2606 gene, herein designated GAM GENE, on one or more GAM2606 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36365] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2606 correlate with, and may be deduced from, the identity of the target genes which GAM2606 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36366] Nucleotide sequences of the GAM2606 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2606 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2606 are further described hereinbelow with reference to Table 1.

[36367] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2606 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36368] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2607 (GAM2607) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36369] GAM2607 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2607 was detected is described hereinabove with reference to Figs. 2-8.

[36370] GAM2607 gene, herein designated GAM GENE, and GAM2607 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36371] GAM2607 gene, herein designated GAM GENE, encodes a GAM2607 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2607 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2607 precursor RNA is designated SEQ ID:2584, and is provided hereinbelow with reference to the sequence listing part.

[36372] GAM2607 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36373] An enzyme complex designated DICER COMPLEX, dices the GAM2607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2607 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2607 RNA is designated SEQ ID:5198, and is provided hereinbelow with reference to the sequence listing part.

[36374] GAM2607 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2607 target RNA, herein designated GAM TARGET RNA. GAM2607 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36375] GAM2607 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2607 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2607 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2607 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2607 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36376] The complementary binding of GAM2607 RNA, herein designated GAM RNA, to target binding sites on GAM2607 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2607 target RNA, herein designated GAM TARGET RNA, into GAM2607 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36377] It is appreciated that GAM2607 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2607 target genes. The mRNA of each one of this plurality of GAM2607 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2607 RNA, herein designated GAM RNA, and which when bound by GAM2607 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2607 target proteins.

[36378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2607 gene, herein designated GAM GENE, on one or more GAM2607 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36379] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2607 correlate with, and may be deduced from, the identity of the target

genes which GAM2607 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36380] Nucleotide sequences of the GAM2607 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2607 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2607 are further described hereinbelow with reference to Table 1.

[36381] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2607 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36382] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2608 (GAM2608) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36383] GAM2608 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2608 was detected is described hereinabove with reference to Figs. 2-8.

[36384] GAM2608 gene, herein designated GAM GENE, and GAM2608 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[36385] GAM2608 gene, herein designated GAM GENE, encodes a GAM2608 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2608 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2608 precursor RNA is designated SEQ ID:2585, and is provided hereinbelow with reference to the sequence listing part.

[36386] GAM2608 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36387] An enzyme complex designated DICER COMPLEX, dices the GAM2608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2608 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2608 RNA is designated SEQ ID:5199, and is provided

hereinbelow with reference to the sequence listing part.

[36388] GAM2608 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2608 target RNA, herein designated GAM TARGET RNA. GAM2608 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36389] GAM2608 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2608 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2608 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2608 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2608 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36390] The complementary binding of GAM2608 RNA, herein designated GAM RNA, to target binding sites on GAM2608 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2608 target RNA, herein designated GAM TARGET RNA, into GAM2608 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36391] It is appreciated that GAM2608 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2608 target genes. The mRNA of each one of this plurality of GAM2608 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2608 RNA, herein designated GAM RNA, and which when bound by GAM2608 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2608 target proteins.

[36392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2608 gene, herein designated GAM GENE, on one or more GAM2608 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36393] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2608 correlate with, and may be deduced from, the identity of the target genes which GAM2608 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36394] Nucleotide sequences of the GAM2608 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2608 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2608 are further described hereinbelow with reference to Table 1.

[36395] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2608 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36396] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2609 (GAM2609) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36397] GAM2609 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2609 was detected is described hereinabove with reference to Figs. 2-8.

[36398] GAM2609 gene, herein designated GAM GENE, and GAM2609 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36399] GAM2609 gene, herein designated GAM GENE, encodes a GAM2609 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2609 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2609 precursor RNA is designated SEQ ID:2586, and is provided hereinbelow with reference to the sequence listing part.

[36400] GAM2609 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36401] An enzyme complex designated DICER COMPLEX, dices the GAM2609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2609 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2609 RNA is designated SEQ ID:5200, and is provided hereinbelow with reference to the sequence listing part.

[36402] GAM2609 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2609 target RNA, herein designated GAM TARGET RNA. GAM2609 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36403] GAM2609 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2609 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2609 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2609 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2609 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36404] The complementary binding of GAM2609 RNA, herein designated GAM RNA, to target binding sites on GAM2609 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2609 target RNA, herein designated GAM TARGET RNA, into GAM2609 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36405] It is appreciated that GAM2609 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2609 target genes. The mRNA of each one of this plurality of GAM2609 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2609 RNA, herein designated GAM RNA, and which when bound by GAM2609 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2609 target proteins.

[36406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2609 gene, herein designated GAM GENE, on one or more GAM2609 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36407] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2609 correlate with, and may be deduced from, the identity of the target genes which GAM2609 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36408] Nucleotide sequences of the GAM2609 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2609 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2609 are further described hereinbelow with reference to Table 1.

[36409] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2609 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36410] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2610 (GAM2610) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [36411] GAM2610 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2610 was detected is described hereinabove with reference to Figs. 2-8.
- [36412] GAM2610 gene, herein designated GAM GENE, and GAM2610 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36413] GAM2610 gene, herein designated GAM GENE, encodes a GAM2610 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2610 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2610 precursor RNA is designated SEQ ID:2587, and is provided hereinbelow with reference to the sequence listing part.
- [36414] GAM2610 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [36415] An enzyme complex designated DICER COMPLEX, dices the GAM2610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2610 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2610 RNA is designated SEQ ID:5201, and is provided hereinbelow with reference to the sequence listing part.
- [36416] GAM2610 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2610 target RNA, herein designated GAM TARGET RNA. GAM2610 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [36417] GAM2610 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2610 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2610 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2610 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2610 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36418] The complementary binding of GAM2610 RNA, herein designated GAM RNA, to target binding sites on GAM2610 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2610 target RNA, herein designated GAM TARGET RNA, into GAM2610 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36419] It is appreciated that GAM2610 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2610 target genes. The mRNA of each one of this plurality of GAM2610 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2610 RNA, herein designated GAM RNA, and which when bound by GAM2610 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2610 target proteins.

[36420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2610 gene, herein designated GAM GENE, on one or more GAM2610 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36421] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2610 correlate with, and may be deduced from, the identity of the target genes which GAM2610 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36422] Nucleotide sequences of the GAM2610 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2610 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2610 are further described hereinbelow with reference to Table 1.

[36423] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2610 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [36424] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2611 (GAM2611) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [36425] GAM2611 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2611 was detected is described hereinabove with reference to Figs. 2-8.
- [36426] GAM2611 gene, herein designated GAM GENE, and GAM2611 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36427] GAM2611 gene, herein designated GAM GENE, encodes a GAM2611 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2611 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2611 precursor RNA is designated SEQ ID:2588, and is provided hereinbelow with reference to the sequence listing part.
- [36428] GAM2611 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36429] An enzyme complex designated DICER COMPLEX, dices the GAM2611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2611 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2611 RNA is designated SEQ ID:5202, and is provided hereinbelow with reference to the sequence listing part.

[36430] GAM2611 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2611 target RNA, herein designated GAM TARGET RNA. GAM2611 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36431] GAM2611 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2611 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2611 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2611 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2611 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36432] The complementary binding of GAM2611 RNA, herein designated GAM RNA, to target binding sites on GAM2611 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2611 target RNA, herein designated GAM TARGET RNA, into GAM2611 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36433] It is appreciated that GAM2611 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2611 target genes. The mRNA of each one of this plurality of GAM2611 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2611 RNA, herein designated GAM RNA, and which when bound by GAM2611 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2611 target proteins.

[36434] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2611 gene, herein designated GAM GENE, on one or more GAM2611 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36435] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2611 correlate with, and may be deduced from, the identity of the target genes which GAM2611 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36436] Nucleotide sequences of the GAM2611 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2611 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2611 are further described hereinbelow with reference to Table 1.

- [36437] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2611 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [36438] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2612 (GAM2612) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [36439] GAM2612 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2612 was detected is described hereinabove with reference to Figs. 2-8.
- [36440] GAM2612 gene, herein designated GAM GENE, and GAM2612 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36441] GAM2612 gene, herein designated GAM GENE, encodes a GAM2612 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2612 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2612 precursor RNA is designated SEQ ID:2589, and is provided hereinbelow with reference to the sequence listing part.

[36442] GAM2612 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2612 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36443] An enzyme complex designated DICER COMPLEX, dices the GAM2612 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2612 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2612 RNA is designated SEQ ID:5203, and is provided hereinbelow with reference to the sequence listing part.

[36444] GAM2612 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2612 target RNA, herein designated GAM TARGET RNA. GAM2612 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36445] GAM2612 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2612 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2612 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2612 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2612 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36446] The complementary binding of GAM2612 RNA, herein designated GAM RNA, to target binding sites on GAM2612 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2612 target RNA, herein designated GAM TARGET RNA, into GAM2612 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36447] It is appreciated that GAM2612 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2612 target genes. The

mRNA of each one of this plurality of GAM2612 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2612 RNA, herein designated GAM RNA, and which when bound by GAM2612 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2612 target proteins.

[36448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2612 gene, herein designated GAM GENE, on one or more GAM2612 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36449] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2612 correlate with, and may be deduced from, the identity of the target genes which GAM2612 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36450] Nucleotide sequences of the GAM2612 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2612 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2612 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2612 are further described hereinbelow with reference to Table 1.

[36451] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2612 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36452] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2613 (GAM2613) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36453] GAM2613 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2613 was detected is described hereinabove with reference to Figs. 2-8.

[36454] GAM2613 gene, herein designated GAM GENE, and GAM2613 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36455] GAM2613 gene, herein designated GAM GENE, encodes a GAM2613 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2613 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2613 precursor RNA is designated SEQ ID:2590, and is provided hereinbelow with reference to the sequence listing part.

[36456] GAM2613 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36457] An enzyme complex designated DICER COMPLEX, dices the GAM2613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2613 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2613 RNA is designated SEQ ID:5204, and is provided hereinbelow with reference to the sequence listing part.

[36458] GAM2613 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2613 target RNA, herein designated GAM TARGET RNA. GAM2613 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36459] GAM2613 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2613 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2613 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2613 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2613 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36460] The complementary binding of GAM2613 RNA, herein designated GAM RNA, to target binding sites on GAM2613 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2613 target RNA, herein designated GAM TARGET RNA, into GAM2613 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36461] It is appreciated that GAM2613 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2613 target genes. The mRNA of each one of this plurality of GAM2613 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2613 RNA, herein designated GAM RNA, and which when bound by GAM2613 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2613 target proteins.

[36462] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2613 gene, herein designated GAM GENE, on one or more GAM2613 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36463] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2613 correlate with, and may be deduced from, the identity of the target

genes which GAM2613 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36464] Nucleotide sequences of the GAM2613 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2613 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2613 are further described hereinbelow with reference to Table 1.

[36465] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2613 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36466] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2614 (GAM2614) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36467] GAM2614 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2614 was detected is described hereinabove with reference to Figs. 2-8.

[36468] GAM2614 gene, herein designated GAM GENE, and GAM2614 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[36469] GAM2614 gene, herein designated GAM GENE, encodes a GAM2614 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2614 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2614 precursor RNA is designated SEQ ID:2591, and is provided hereinbelow with reference to the sequence listing part.

[36470] GAM2614 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36471] An enzyme complex designated DICER COMPLEX, dices the GAM2614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2614 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2614 RNA is designated SEQ ID:5205, and is provided

hereinbelow with reference to the sequence listing part.

[36472] GAM2614 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2614 target RNA, herein designated GAM TARGET RNA. GAM2614 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36473] GAM2614 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2614 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2614 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2614 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2614 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36474] The complementary binding of GAM2614 RNA, herein designated GAM RNA, to target binding sites on GAM2614 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2614 target RNA, herein designated GAM TARGET RNA, into GAM2614 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36475] It is appreciated that GAM2614 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2614 target genes. The mRNA of each one of this plurality of GAM2614 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2614 RNA, herein designated GAM RNA, and which when bound by GAM2614 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2614 target proteins.

[36476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2614 gene, herein designated GAM GENE, on one or more GAM2614 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36477] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2614 correlate with, and may be deduced from, the identity of the target genes which GAM2614 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36478] Nucleotide sequences of the GAM2614 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2614 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2614 are further described hereinbelow with reference to Table 1.

[36479] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2614 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36480] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2615 (GAM2615) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36481] GAM2615 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2615 was detected is described hereinabove with reference to Figs. 2-8.

[36482] GAM2615 gene, herein designated GAM GENE, and GAM2615 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36483] GAM2615 gene, herein designated GAM GENE, encodes a GAM2615 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2615 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2615 precursor RNA is designated SEQ ID:2592, and is provided hereinbelow with reference to the sequence listing part.

[36484] GAM2615 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36485] An enzyme complex designated DICER COMPLEX, dices the GAM2615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2615 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2615 RNA is designated SEQ ID:5206, and is provided hereinbelow with reference to the sequence listing part.

[36486] GAM2615 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2615 target RNA, herein designated GAM TARGET RNA. GAM2615 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36487] GAM2615 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2615 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2615 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2615 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2615 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36488] The complementary binding of GAM2615 RNA, herein designated GAM RNA, to target binding sites on GAM2615 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2615 target RNA, herein designated GAM TARGET RNA, into GAM2615 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36489] It is appreciated that GAM2615 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2615 target genes. The mRNA of each one of this plurality of GAM2615 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2615 RNA, herein designated GAM RNA, and which when bound by GAM2615 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2615 target proteins.

[36490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2615 gene, herein designated GAM GENE, on one or more GAM2615 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36491] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2615 correlate with, and may be deduced from, the identity of the target genes which GAM2615 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36492] Nucleotide sequences of the GAM2615 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2615 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2615 are further described hereinbelow with reference to Table 1.

[36493] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2615 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36494] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2616 (GAM2616) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36495] GAM2616 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2616 was detected is described hereinabove with reference to Figs. 2-8.

[36496] GAM2616 gene, herein designated GAM GENE, and GAM2616 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36497] GAM2616 gene, herein designated GAM GENE, encodes a GAM2616 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2616 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2616 precursor RNA is designated SEQ ID:2593, and is provided hereinbelow with reference to the sequence listing part.

[36498] GAM2616 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36499] An enzyme complex designated DICER COMPLEX, dices the GAM2616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2616 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2616 RNA is designated SEQ ID:5207, and is provided hereinbelow with reference to the sequence listing part.

[36500] GAM2616 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2616 target RNA, herein designated GAM TARGET RNA. GAM2616 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36501] GAM2616 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2616 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2616 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2616 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2616 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36502] The complementary binding of GAM2616 RNA, herein designated GAM RNA, to target binding sites on GAM2616 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2616 target RNA, herein designated GAM TARGET RNA, into GAM2616 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36503] It is appreciated that GAM2616 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2616 target genes. The mRNA of each one of this plurality of GAM2616 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2616 RNA, herein designated GAM RNA, and which when bound by GAM2616 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2616 target proteins.

[36504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2616 gene, herein designated GAM GENE, on one or more GAM2616 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36505] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2616 correlate with, and may be deduced from, the identity of the target genes which GAM2616 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36506] Nucleotide sequences of the GAM2616 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2616 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2616 are further described hereinbelow with reference to Table 1.

[36507] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2616 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[36508] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2617 (GAM2617) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36509] GAM2617 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2617 was detected is described hereinabove with reference to Figs. 2-8.

[36510] GAM2617 gene, herein designated GAM GENE, and GAM2617 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36511] GAM2617 gene, herein designated GAM GENE, encodes a GAM2617 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2617 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2617 precursor RNA is designated SEQ ID:2594, and is provided hereinbelow with reference to the sequence listing part.

[36512] GAM2617 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36513] An enzyme complex designated DICER COMPLEX, dices the GAM2617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2617 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2617 RNA is designated SEQ ID:5208, and is provided hereinbelow with reference to the sequence listing part.

[36514] GAM2617 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2617 target RNA, herein designated GAM TARGET RNA. GAM2617 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36515] GAM2617 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2617 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2617 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2617 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2617 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36516] The complementary binding of GAM2617 RNA, herein designated GAM RNA, to target binding sites on GAM2617 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2617 target RNA, herein designated GAM TARGET RNA, into GAM2617 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36517] It is appreciated that GAM2617 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2617 target genes. The mRNA of each one of this plurality of GAM2617 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2617 RNA, herein designated GAM RNA, and which when bound by GAM2617 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2617 target proteins.

[36518] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2617 gene, herein designated GAM GENE, on one or more GAM2617 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36519] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2617 correlate with, and may be deduced from, the identity of the target genes which GAM2617 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36520] Nucleotide sequences of the GAM2617 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2617 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2617 are further described hereinbelow with reference to Table 1.

[36521] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2617 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36522] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2618 (GAM2618) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36523] GAM2618 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2618 was detected is described hereinabove with reference to Figs. 2-8.

[36524] GAM2618 gene, herein designated GAM GENE, and GAM2618 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36525] GAM2618 gene, herein designated GAM GENE, encodes a GAM2618 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2618 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2618 precursor RNA is designated SEQ ID:2595, and is provided hereinbelow with reference to the sequence listing part.

[36526] GAM2618 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36527] An enzyme complex designated DICER COMPLEX, dices the GAM2618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2618 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2618 RNA is designated SEQ ID:5209, and is provided hereinbelow with reference to the sequence listing part.

[36528] GAM2618 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2618 target RNA, herein designated GAM TARGET RNA. GAM2618 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36529] GAM2618 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2618 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2618 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2618 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2618 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36530] The complementary binding of GAM2618 RNA, herein designated GAM RNA, to target binding sites on GAM2618 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2618 target RNA, herein designated GAM TARGET RNA, into GAM2618 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36531] It is appreciated that GAM2618 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2618 target genes. The

mRNA of each one of this plurality of GAM2618 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2618 RNA, herein designated GAM RNA, and which when bound by GAM2618 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2618 target proteins.

[36532] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2618 gene, herein designated GAM GENE, on one or more GAM2618 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36533] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2618 correlate with, and may be deduced from, the identity of the target genes which GAM2618 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36534] Nucleotide sequences of the GAM2618 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2618 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2618 are further described hereinbelow with reference to Table 1.

[36535] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2618 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36536] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2619 (GAM2619) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36537] GAM2619 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2619 was detected is described hereinabove with reference to Figs. 2-8.

[36538] GAM2619 gene, herein designated GAM GENE, and GAM2619 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36539] GAM2619 gene, herein designated GAM GENE, encodes a GAM2619 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2619 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2619 precursor RNA is designated SEQ ID:2596, and is provided hereinbelow with reference to the sequence listing part.

[36540] GAM2619 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36541] An enzyme complex designated DICER COMPLEX, dices the GAM2619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2619 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2619 RNA is designated SEQ ID:5210, and is provided hereinbelow with reference to the sequence listing part.

[36542] GAM2619 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2619 target RNA, herein designated GAM TARGET RNA. GAM2619 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36543] GAM2619 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2619 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2619 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2619 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2619 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36544] The complementary binding of GAM2619 RNA, herein designated GAM RNA, to target binding sites on GAM2619 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2619 target RNA, herein designated GAM TARGET RNA, into GAM2619 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36545] It is appreciated that GAM2619 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2619 target genes. The mRNA of each one of this plurality of GAM2619 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2619 RNA, herein designated GAM RNA, and which when bound by GAM2619 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2619 target proteins.

[36546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2619 gene, herein designated GAM GENE, on one or more GAM2619 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36547] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2619 correlate with, and may be deduced from, the identity of the target

genes which GAM2619 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36548] Nucleotide sequences of the GAM2619 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2619 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2619 are further described hereinbelow with reference to Table 1.

[36549] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2619 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36550] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2620 (GAM2620) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36551] GAM2620 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2620 was detected is described hereinabove with reference to Figs. 2-8.

[36552] GAM2620 gene, herein designated GAM GENE, and GAM2620 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[36553] GAM2620 gene, herein designated GAM GENE, encodes a GAM2620 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2620 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2620 precursor RNA is designated SEQ ID:2597, and is provided hereinbelow with reference to the sequence listing part.

[36554] GAM2620 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36555] An enzyme complex designated DICER COMPLEX, dices the GAM2620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2620 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2620 RNA is designated SEQ ID:5211, and is provided

hereinbelow with reference to the sequence listing part.

[36556] GAM2620 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2620 target RNA, herein designated GAM TARGET RNA. GAM2620 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36557] GAM2620 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2620 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2620 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2620 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2620 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36558] The complementary binding of GAM2620 RNA, herein designated GAM RNA, to target binding sites on GAM2620 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2620 target RNA, herein designated GAM TARGET RNA, into GAM2620 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36559] It is appreciated that GAM2620 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2620 target genes. The mRNA of each one of this plurality of GAM2620 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2620 RNA, herein designated GAM RNA, and which when bound by GAM2620 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2620 target proteins.

[36560] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2620 gene, herein designated GAM GENE, on one or more GAM2620 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36561] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2620 correlate with, and may be deduced from, the identity of the target genes which GAM2620 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36562] Nucleotide sequences of the GAM2620 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2620 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2620 are further described hereinbelow with reference to Table 1.

[36563] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2620 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36564] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2621 (GAM2621) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36565] GAM2621 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2621 was detected is described hereinabove with reference to Figs. 2-8.

[36566] GAM2621 gene, herein designated GAM GENE, and GAM2621 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36567] GAM2621 gene, herein designated GAM GENE, encodes a GAM2621 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2621 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2621 precursor RNA is designated SEQ ID:2598, and is provided hereinbelow with reference to the sequence listing part.

[36568] GAM2621 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36569] An enzyme complex designated DICER COMPLEX, dices the GAM2621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2621 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2621 RNA is designated SEQ ID:5212, and is provided hereinbelow with reference to the sequence listing part.

[36570] GAM2621 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2621 target RNA, herein designated GAM TARGET RNA. GAM2621 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36571] GAM2621 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2621 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2621 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2621 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2621 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36572] The complementary binding of GAM2621 RNA, herein designated GAM RNA, to target binding sites on GAM2621 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2621 target RNA, herein designated GAM TARGET RNA, into GAM2621 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36573] It is appreciated that GAM2621 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2621 target genes. The mRNA of each one of this plurality of GAM2621 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2621 RNA, herein designated GAM RNA, and which when bound by GAM2621 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2621 target proteins.

[36574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2621 gene, herein designated GAM GENE, on one or more GAM2621 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36575] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2621 correlate with, and may be deduced from, the identity of the target genes which GAM2621 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36576] Nucleotide sequences of the GAM2621 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2621 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2621 are further described hereinbelow with reference to Table 1.

[36577] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2621 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36578] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2622 (GAM2622) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36579] GAM2622 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2622 was detected is described hereinabove with reference to Figs. 2-8.

[36580] GAM2622 gene, herein designated GAM GENE, and GAM2622 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36581] GAM2622 gene, herein designated GAM GENE, encodes a GAM2622 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2622 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2622 precursor RNA is designated SEQ ID:2599, and is provided hereinbelow with reference to the sequence listing part.

[36582] GAM2622 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [36583] An enzyme complex designated DICER COMPLEX, dices the GAM2622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2622 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2622 RNA is designated SEQ ID:5213, and is provided hereinbelow with reference to the sequence listing part.
- [36584] GAM2622 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2622 target RNA, herein designated GAM TARGET RNA. GAM2622 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [36585] GAM2622 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2622 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2622 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2622 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2622 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36586] The complementary binding of GAM2622 RNA, herein designated GAM RNA, to target binding sites on GAM2622 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2622 target RNA, herein designated GAM TARGET RNA, into GAM2622 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36587] It is appreciated that GAM2622 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2622 target genes. The mRNA of each one of this plurality of GAM2622 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2622 RNA, herein designated GAM RNA, and which when bound by GAM2622 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2622 target proteins.

[36588] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2622 gene, herein designated GAM GENE, on one or more GAM2622 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36589] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2622 correlate with, and may be deduced from, the identity of the target genes which GAM2622 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36590] Nucleotide sequences of the GAM2622 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2622 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2622 are further described hereinbelow with reference to Table 1.

[36591] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2622 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[36592] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2623 (GAM2623) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36593] GAM2623 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2623 was detected is described hereinabove with reference to Figs. 2-8.

[36594] GAM2623 gene, herein designated GAM GENE, and GAM2623 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36595] GAM2623 gene, herein designated GAM GENE, encodes a GAM2623 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2623 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2623 precursor RNA is designated SEQ ID:2600, and is provided hereinbelow with reference to the sequence listing part.

[36596] GAM2623 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36597] An enzyme complex designated DICER COMPLEX, dices the GAM2623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2623 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2623 RNA is designated SEQ ID:5214, and is provided hereinbelow with reference to the sequence listing part.

[36598] GAM2623 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2623 target RNA, herein designated GAM TARGET RNA. GAM2623 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36599] GAM2623 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2623 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2623 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2623 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2623 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36600] The complementary binding of GAM2623 RNA, herein designated GAM RNA, to target binding sites on GAM2623 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2623 target RNA, herein designated GAM TARGET RNA, into GAM2623 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36601] It is appreciated that GAM2623 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2623 target genes. The mRNA of each one of this plurality of GAM2623 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2623 RNA, herein designated GAM RNA, and which when bound by GAM2623 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2623 target proteins.

[36602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2623 gene, herein designated GAM GENE, on one or more GAM2623 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36603] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2623 correlate with, and may be deduced from, the identity of the target genes which GAM2623 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36604] Nucleotide sequences of the GAM2623 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2623 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2623 are further described hereinbelow with reference to Table 1.

- [36605] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2623 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.
- [36606] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2624 (GAM2624) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [36607] GAM2624 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2624 was detected is described hereinabove with reference to Figs. 2-8.
- [36608] GAM2624 gene, herein designated GAM GENE, and GAM2624 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36609] GAM2624 gene, herein designated GAM GENE, encodes a GAM2624 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2624 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2624 precursor RNA is designated SEQ ID:2601, and is provided hereinbelow with reference to the sequence listing part.

[36610] GAM2624 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36611] An enzyme complex designated DICER COMPLEX, dices the GAM2624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2624 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2624 RNA is designated SEQ ID:5215, and is provided hereinbelow with reference to the sequence listing part.

[36612] GAM2624 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2624 target RNA, herein designated GAM TARGET RNA. GAM2624 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36613] GAM2624 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2624 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2624 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2624 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2624 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36614] The complementary binding of GAM2624 RNA, herein designated GAM RNA, to target binding sites on GAM2624 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2624 target RNA, herein designated GAM TARGET RNA, into GAM2624 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36615] It is appreciated that GAM2624 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2624 target genes. The

mRNA of each one of this plurality of GAM2624 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2624 RNA, herein designated GAM RNA, and which when bound by GAM2624 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2624 target proteins.

[36616] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2624 gene, herein designated GAM GENE, on one or more GAM2624 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36617] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2624 correlate with, and may be deduced from, the identity of the target genes which GAM2624 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36618] Nucleotide sequences of the GAM2624 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2624 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2624 are further described hereinbelow with reference to Table 1.

[36619] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2624 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36620] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2625 (GAM2625) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36621] GAM2625 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2625 was detected is described hereinabove with reference to Figs. 2-8.

[36622] GAM2625 gene, herein designated GAM GENE, and GAM2625 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36623] GAM2625 gene, herein designated GAM GENE, encodes a GAM2625 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2625 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2625 precursor RNA is designated SEQ ID:2602, and is provided hereinbelow with reference to the sequence listing part.

[36624] GAM2625 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36625] An enzyme complex designated DICER COMPLEX, dices the GAM2625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2625 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2625 RNA is designated SEQ ID:5216, and is provided hereinbelow with reference to the sequence listing part.

[36626] GAM2625 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2625 target RNA, herein designated GAM TARGET RNA. GAM2625 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36627] GAM2625 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2625 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2625 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2625 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2625 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36628] The complementary binding of GAM2625 RNA, herein designated GAM RNA, to target binding sites on GAM2625 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2625 target RNA, herein designated GAM TARGET RNA, into GAM2625 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36629] It is appreciated that GAM2625 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2625 target genes. The mRNA of each one of this plurality of GAM2625 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2625 RNA, herein designated GAM RNA, and which when bound by GAM2625 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2625 target proteins.

[36630] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2625 gene, herein designated GAM GENE, on one or more GAM2625 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36631] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2625 correlate with, and may be deduced from, the identity of the target

genes which GAM2625 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36632] Nucleotide sequences of the GAM2625 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2625 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2625 are further described hereinbelow with reference to Table 1.

[36633] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2625 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36634] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2626 (GAM2626) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36635] GAM2626 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2626 was detected is described hereinabove with reference to Figs. 2-8.

[36636] GAM2626 gene, herein designated GAM GENE, and GAM2626 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[36637] GAM2626 gene, herein designated GAM GENE, encodes a GAM2626 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2626 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2626 precursor RNA is designated SEQ ID:2603, and is provided hereinbelow with reference to the sequence listing part.

[36638] GAM2626 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36639] An enzyme complex designated DICER COMPLEX, dices the GAM2626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2626 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2626 RNA is designated SEQ ID:5217, and is provided

hereinbelow with reference to the sequence listing part.

[36640] GAM2626 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2626 target RNA, herein designated GAM TARGET RNA. GAM2626 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36641] GAM2626 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2626 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2626 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2626 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2626 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36642] The complementary binding of GAM2626 RNA, herein designated GAM RNA, to target binding sites on GAM2626 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2626 target RNA, herein designated GAM TARGET RNA, into GAM2626 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36643] It is appreciated that GAM2626 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2626 target genes. The mRNA of each one of this plurality of GAM2626 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2626 RNA, herein designated GAM RNA, and which when bound by GAM2626 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2626 target proteins.

[36644] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2626 gene, herein designated GAM GENE, on one or more GAM2626 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36645] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2626 correlate with, and may be deduced from, the identity of the target genes which GAM2626 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36646] Nucleotide sequences of the GAM2626 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2626 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2626 are further described hereinbelow with reference to Table 1.

[36647] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2626 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36648] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2627 (GAM2627) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36649] GAM2627 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2627 was detected is described hereinabove with reference to Figs. 2-8.

[36650] GAM2627 gene, herein designated GAM GENE, and GAM2627 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36651] GAM2627 gene, herein designated GAM GENE, encodes a GAM2627 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2627 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2627 precursor RNA is designated SEQ ID:2604, and is provided hereinbelow with reference to the sequence listing part.

[36652] GAM2627 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36653] An enzyme complex designated DICER COMPLEX, dices the GAM2627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2627 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2627 RNA is designated SEQ ID:5218, and is provided hereinbelow with reference to the sequence listing part.

[36654] GAM2627 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2627 target RNA, herein designated GAM TARGET RNA. GAM2627 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36655] GAM2627 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2627 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2627 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2627 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2627 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36656] The complementary binding of GAM2627 RNA, herein designated GAM RNA, to target binding sites on GAM2627 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2627 target RNA, herein designated GAM TARGET RNA, into GAM2627 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36657] It is appreciated that GAM2627 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2627 target genes. The mRNA of each one of this plurality of GAM2627 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2627 RNA, herein designated GAM RNA, and which when bound by GAM2627 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2627 target proteins.

[36658] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2627 gene, herein designated GAM GENE, on one or more GAM2627 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36659] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2627 correlate with, and may be deduced from, the identity of the target genes which GAM2627 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36660] Nucleotide sequences of the GAM2627 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2627 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2627 are further described hereinbelow with reference to Table 1.

[36661] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2627 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36662] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2628 (GAM2628) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [36663] GAM2628 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2628 was detected is described hereinabove with reference to Figs. 2-8.
- [36664] GAM2628 gene, herein designated GAM GENE, and GAM2628 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36665] GAM2628 gene, herein designated GAM GENE, encodes a GAM2628 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2628 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2628 precursor RNA is designated SEQ ID:2605, and is provided hereinbelow with reference to the sequence listing part.
- [36666] GAM2628 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [36667] An enzyme complex designated DICER COMPLEX, dices the GAM2628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2628 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2628 RNA is designated SEQ ID:5219, and is provided hereinbelow with reference to the sequence listing part.
- [36668] GAM2628 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2628 target RNA, herein designated GAM TARGET RNA. GAM2628 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [36669] GAM2628 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2628 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2628 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2628 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2628 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36670] The complementary binding of GAM2628 RNA, herein designated GAM RNA, to target binding sites on GAM2628 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2628 target RNA, herein designated GAM TARGET RNA, into GAM2628 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36671] It is appreciated that GAM2628 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2628 target genes. The mRNA of each one of this plurality of GAM2628 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2628 RNA, herein designated GAM RNA, and which when bound by GAM2628 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2628 target proteins.

[36672] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2628 gene, herein designated GAM GENE, on one or more GAM2628 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36673] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2628 correlate with, and may be deduced from, the identity of the target genes which GAM2628 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36674] Nucleotide sequences of the GAM2628 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2628 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2628 are further described hereinbelow with reference to Table 1.

[36675] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2628 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [36676] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2629 (GAM2629) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [36677] GAM2629 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2629 was detected is described hereinabove with reference to Figs. 2-8.
- [36678] GAM2629 gene, herein designated GAM GENE, and GAM2629 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36679] GAM2629 gene, herein designated GAM GENE, encodes a GAM2629 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2629 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2629 precursor RNA is designated SEQ ID:2606, and is provided hereinbelow with reference to the sequence listing part.
- [36680] GAM2629 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36681] An enzyme complex designated DICER COMPLEX, dices the GAM2629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2629 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2629 RNA is designated SEQ ID:5220, and is provided hereinbelow with reference to the sequence listing part.

[36682] GAM2629 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2629 target RNA, herein designated GAM TARGET RNA. GAM2629 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36683] GAM2629 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2629 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2629 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2629 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2629 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36684] The complementary binding of GAM2629 RNA, herein designated GAM RNA, to target binding sites on GAM2629 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2629 target RNA, herein designated GAM TARGET RNA, into GAM2629 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36685] It is appreciated that GAM2629 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2629 target genes. The mRNA of each one of this plurality of GAM2629 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2629 RNA, herein designated GAM RNA, and which when bound by GAM2629 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2629 target proteins.

[36686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2629 gene, herein designated GAM GENE, on one or more GAM2629 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36687] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2629 correlate with, and may be deduced from, the identity of the target genes which GAM2629 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36688] Nucleotide sequences of the GAM2629 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2629 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2629 are further described hereinbelow with reference to Table 1.

[36689] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2629 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36690] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2630 (GAM2630) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36691] GAM2630 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2630 was detected is described hereinabove with reference to Figs. 2-8.

[36692] GAM2630 gene, herein designated GAM GENE, and GAM2630 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36693] GAM2630 gene, herein designated GAM GENE, encodes a GAM2630 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2630 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2630 precursor RNA is designated SEQ ID:2607, and is provided hereinbelow with reference to the sequence listing part.

[36694] GAM2630 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36695] An enzyme complex designated DICER COMPLEX, dices the GAM2630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2630 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM2630 RNA is designated SEQ ID:5221, and is provided hereinbelow with reference to the sequence listing part.

[36696] GAM2630 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2630 target RNA, herein designated GAM TARGET RNA. GAM2630 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36697] GAM2630 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2630 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2630 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2630 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2630 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36698] The complementary binding of GAM2630 RNA, herein designated GAM RNA, to target binding sites on GAM2630 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2630 target RNA, herein designated GAM TARGET RNA, into GAM2630 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36699] It is appreciated that GAM2630 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2630 target genes. The

mRNA of each one of this plurality of GAM2630 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2630 RNA, herein designated GAM RNA, and which when bound by GAM2630 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2630 target proteins.

[36700] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2630 gene, herein designated GAM GENE, on one or more GAM2630 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36701] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2630 correlate with, and may be deduced from, the identity of the target genes which GAM2630 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36702] Nucleotide sequences of the GAM2630 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2630 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2630 are further described hereinbelow with reference to Table 1.

[36703] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2630 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36704] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2631 (GAM2631) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36705] GAM2631 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2631 was detected is described hereinabove with reference to Figs. 2-8.

[36706] GAM2631 gene, herein designated GAM GENE, and GAM2631 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36707] GAM2631 gene, herein designated GAM GENE, encodes a GAM2631 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2631 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2631 precursor RNA is designated SEQ ID:2608, and is provided hereinbelow with reference to the sequence listing part.

[36708] GAM2631 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36709] An enzyme complex designated DICER COMPLEX, dices the GAM2631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2631 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM2631 RNA is designated SEQ ID:5222, and is provided hereinbelow with reference to the sequence listing part.

[36710] GAM2631 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2631 target RNA, herein designated GAM TARGET RNA. GAM2631 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36711] GAM2631 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2631 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2631 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2631 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2631 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36712] The complementary binding of GAM2631 RNA, herein designated GAM RNA, to target binding sites on GAM2631 target RNA, herein designated

GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2631 target RNA, herein designated GAM TARGET RNA, into GAM2631 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36713] It is appreciated that GAM2631 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2631 target genes. The mRNA of each one of this plurality of GAM2631 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2631 RNA, herein designated GAM RNA, and which when bound by GAM2631 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2631 target proteins.

[36714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2631 gene, herein designated GAM GENE, on one or more GAM2631 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36715] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2631 correlate with, and may be deduced from, the identity of the target genes which GAM2631 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36716] Nucleotide sequences of the GAM2631 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2631 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2631 are further described hereinbelow with reference to Table 1.

[36717] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2631 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36718] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2632 (GAM2632) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36719] GAM2632 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2632 was detected is described hereinabove with reference to Figs. 2-8.

[36720] GAM2632 gene, herein designated GAM GENE, and GAM2632 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36721] GAM2632 gene, herein designated GAM GENE, encodes a GAM2632 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2632 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2632 precursor RNA is designated SEQ ID:2609, and is provided hereinbelow with reference to the sequence listing part.

[36722] GAM2632 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36723] An enzyme complex designated DICER COMPLEX, dices the GAM2632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2632 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2632 RNA is designated SEQ ID:5223, and is provided hereinbelow with reference to the sequence listing part.

[36724] GAM2632 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2632 target RNA, herein designated GAM TARGET RNA. GAM2632 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36725] GAM2632 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2632 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2632 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2632 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2632 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[36726] The complementary binding of GAM2632 RNA, herein designated GAM RNA, to target binding sites on GAM2632 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2632 target RNA, herein designated GAM TARGET RNA, into GAM2632 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36727] It is appreciated that GAM2632 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2632 target genes. The mRNA of each one of this plurality of GAM2632 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2632 RNA, herein designated GAM RNA, and which when bound by GAM2632 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2632 target proteins.

[36728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2632 gene, herein designated GAM GENE, on one or more GAM2632 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36729] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2632 correlate with, and may be deduced from, the identity of the target genes which GAM2632 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36730] Nucleotide sequences of the GAM2632 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2632 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2632 are further described hereinbelow with reference to Table 1.

[36731] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2632 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36732] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2633 (GAM2633) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

- [36733] GAM2633 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2633 was detected is described hereinabove with reference to Figs. 2-8.
- [36734] GAM2633 gene, herein designated GAM GENE, and GAM2633 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36735] GAM2633 gene, herein designated GAM GENE, encodes a GAM2633 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2633 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2633 precursor RNA is designated SEQ ID:2610, and is provided hereinbelow with reference to the sequence listing part.
- [36736] GAM2633 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [36737] An enzyme complex designated DICER COMPLEX, dices the GAM2633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2633 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2633 RNA is designated SEQ ID:5225, and is provided hereinbelow with reference to the sequence listing part.

[36738] GAM2633 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2633 target RNA, herein designated GAM TARGET RNA. GAM2633 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36739] GAM2633 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2633 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2633 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2633 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2633 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36740] The complementary binding of GAM2633 RNA, herein designated GAM RNA, to target binding sites on GAM2633 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2633 target RNA, herein designated GAM TARGET RNA, into GAM2633 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36741] It is appreciated that GAM2633 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2633 target genes. The mRNA of each one of this plurality of GAM2633 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2633 RNA, herein designated GAM RNA, and which when bound by GAM2633 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2633 target proteins.

[36742] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2633 gene, herein designated GAM GENE, on one or more GAM2633 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36743] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2633 correlate with, and may be deduced from, the identity of the target genes which GAM2633 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36744] Nucleotide sequences of the GAM2633 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2633 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2633 are further described hereinbelow with reference to Table 1.

[36745] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2633 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36746] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 2634 (GAM2634) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36747] GAM2634 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2634 was detected is described hereinabove with reference to Figs. 2-8.

[36748] GAM2634 gene, herein designated GAM GENE, and GAM2634 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36749] GAM2634 gene, herein designated GAM GENE, encodes a GAM2634 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2634 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2634 precursor RNA is designated SEQ ID:2611, and is provided hereinbelow with reference to the sequence listing part.

[36750] GAM2634 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [36751] An enzyme complex designated DICER COMPLEX, dices the GAM2634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2634 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2634 RNA is designated SEQ ID:5226, and is provided hereinbelow with reference to the sequence listing part.
- [36752] GAM2634 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2634 target RNA, herein designated GAM TARGET RNA. GAM2634 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [36753] GAM2634 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2634 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2634 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2634 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2634 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36754] The complementary binding of GAM2634 RNA, herein designated GAM RNA, to target binding sites on GAM2634 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2634 target RNA, herein designated GAM TARGET RNA, into GAM2634 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36755] It is appreciated that GAM2634 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2634 target genes. The mRNA of each one of this plurality of GAM2634 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2634 RNA, herein designated GAM RNA, and which when bound by GAM2634 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2634 target proteins.

[36756] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2634 gene, herein designated GAM GENE, on one or more GAM2634 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36757] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2634 correlate with, and may be deduced from, the identity of the target genes which GAM2634 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36758] Nucleotide sequences of the GAM2634 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2634 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2634 are further described hereinbelow with reference to Table 1.

[36759] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2634 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

- [36760] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2635 (GAM2635) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
- [36761] GAM2635 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2635 was detected is described hereinabove with reference to Figs. 2-8.
- [36762] GAM2635 gene, herein designated GAM GENE, and GAM2635 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.
- [36763] GAM2635 gene, herein designated GAM GENE, encodes a GAM2635 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2635 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2635 precursor RNA is designated SEQ ID:2612, and is provided hereinbelow with reference to the sequence listing part.
- [36764] GAM2635 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2635 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36765] An enzyme complex designated DICER COMPLEX, dices the GAM2635 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2635 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2635 RNA is designated SEQ ID:5224, and is provided hereinbelow with reference to the sequence listing part.

[36766] GAM2635 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2635 target RNA, herein designated GAM TARGET RNA. GAM2635 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36767] GAM2635 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2635 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2635 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2635 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2635 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36768] The complementary binding of GAM2635 RNA, herein designated GAM RNA, to target binding sites on GAM2635 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2635 target RNA, herein designated GAM TARGET RNA, into GAM2635 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36769] It is appreciated that GAM2635 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2635 target genes. The mRNA of each one of this plurality of GAM2635 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2635 RNA, herein designated GAM RNA, and which when bound by GAM2635 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2635 target proteins.

[36770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2635 gene, herein designated GAM GENE, on one or more GAM2635 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36771] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2635 correlate with, and may be deduced from, the identity of the target genes which GAM2635 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36772] Nucleotide sequences of the GAM2635 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2635 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2635 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2635 are further described hereinbelow with reference to Table 1.

[36773] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2635 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36774] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2636 (GAM2636) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36775] GAM2636 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2636 was detected is described hereinabove with reference to Figs. 2-8.

[36776] GAM2636 gene, herein designated GAM GENE, and GAM2636 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36777] GAM2636 gene, herein designated GAM GENE, encodes a GAM2636 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2636 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2636 precursor RNA is designated SEQ ID:2613, and is provided hereinbelow with reference to the sequence listing part.

[36778] GAM2636 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36779] An enzyme complex designated DICER COMPLEX, dices the GAM2636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2636 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2636 RNA is designated SEQ ID:5227, and is provided hereinbelow with reference to the sequence listing part.

[36780] GAM2636 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2636 target RNA, herein designated GAM TARGET RNA. GAM2636 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36781] GAM2636 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2636 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2636 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2636 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2636 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36782] The complementary binding of GAM2636 RNA, herein designated GAM RNA, to target binding sites on GAM2636 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2636 target RNA, herein designated GAM TARGET RNA, into GAM2636 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36783] It is appreciated that GAM2636 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2636 target genes. The

mRNA of each one of this plurality of GAM2636 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2636 RNA, herein designated GAM RNA, and which when bound by GAM2636 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2636 target proteins.

[36784] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2636 gene, herein designated GAM GENE, on one or more GAM2636 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36785] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2636 correlate with, and may be deduced from, the identity of the target genes which GAM2636 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36786] Nucleotide sequences of the GAM2636 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2636 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2636 are further described hereinbelow with reference to Table 1.

[36787] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2636 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36788] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2637 (GAM2637) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36789] GAM2637 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2637 was detected is described hereinabove with reference to Figs. 2-8.

[36790] GAM2637 gene, herein designated GAM GENE, and GAM2637 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[36791] GAM2637 gene, herein designated GAM GENE, encodes a GAM2637 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2637 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2637 precursor RNA is designated SEQ ID:2614, and is provided hereinbelow with reference to the sequence listing part.

[36792] GAM2637 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36793] An enzyme complex designated DICER COMPLEX, dices the GAM2637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2637 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2637 RNA is designated SEQ ID:5228, and is provided hereinbelow with reference to the sequence listing part.

[36794] GAM2637 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2637 target RNA, herein designated GAM TARGET RNA. GAM2637 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36795] GAM2637 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2637 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2637 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2637 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2637 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36796] The complementary binding of GAM2637 RNA, herein designated GAM RNA, to target binding sites on GAM2637 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2637 target RNA, herein designated GAM TARGET RNA, into GAM2637 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36797] It is appreciated that GAM2637 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2637 target genes. The mRNA of each one of this plurality of GAM2637 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2637 RNA, herein designated GAM RNA, and which when bound by GAM2637 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2637 target proteins.

[36798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2637 gene, herein designated GAM GENE, on one or more GAM2637 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36799] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2637 correlate with, and may be deduced from, the identity of the target

genes which GAM2637 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36800] Nucleotide sequences of the GAM2637 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2637 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2637 are further described hereinbelow with reference to Table 1.

[36801] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2637 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36802] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2638 (GAM2638) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[36803] GAM2638 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2638 was detected is described hereinabove with reference to Figs. 2-8.

[36804] GAM2638 gene, herein designated GAM GENE, and GAM2638 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[36805] GAM2638 gene, herein designated GAM GENE, encodes a GAM2638 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2638 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2638 precursor RNA is designated SEQ ID:2615, and is provided hereinbelow with reference to the sequence listing part.

[36806] GAM2638 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36807] An enzyme complex designated DICER COMPLEX, dices the GAM2638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2638 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2638 RNA is designated SEQ ID:5229, and is provided

hereinbelow with reference to the sequence listing part.

[36808] GAM2638 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2638 target RNA, herein designated GAM TARGET RNA. GAM2638 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36809] GAM2638 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2638 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2638 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2638 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2638 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36810] The complementary binding of GAM2638 RNA, herein designated GAM RNA, to target binding sites on GAM2638 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2638 target RNA, herein designated GAM TARGET RNA, into GAM2638 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[36811] It is appreciated that GAM2638 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2638 target genes. The mRNA of each one of this plurality of GAM2638 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2638 RNA, herein designated GAM RNA, and which when bound by GAM2638 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2638 target proteins.

[36812] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2638 gene, herein designated GAM GENE, on one or more GAM2638 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36813] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2638 correlate with, and may be deduced from, the identity of the target genes which GAM2638 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[36814] Nucleotide sequences of the GAM2638 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2638 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2638 are further described hereinbelow with reference to Table 1.

[36815] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2638 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[36816] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2639 (GR2639) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

- [36817] GR2639 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2639 gene was detected is described hereinabove with reference to Figs. 6-15.
- [36818] GR2639 gene encodes GR2639 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [36819] GR2639 precursor RNA folds spatially, forming GR2639 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2639 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2639 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [36820] GR2639 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM24 precursor RNA, GAM25 precursor RNA and GAM26 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36821] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM24 RNA, GAM25 RNA and GAM26 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36822] GAM24 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM24 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM24 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM24 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36823] GAM25 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM25 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM25 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM25 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36824] GAM26 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of

GAM26 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM26 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM26 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[36825] It is appreciated that specific functions, and accordingly utilities, of GR2639 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2639 gene: GAM24 target protein, GAM25 target protein and GAM26 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM24, GAM25 and GAM26

[36826] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2640(GR2640) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36827] GR2640 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2640 gene was detected is described hereinabove with reference to Figs. 6-15.

[36828] GR2640 gene encodes GR2640 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36829] GR2640 precursor RNA folds spatially, forming GR2640 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2640 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2640 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36830] GR2640 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM27 precursor RNA, GAM28 precursor RNA and GAM29 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36831] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM27 RNA, GAM28 RNA and GAM29 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA

respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36832] GAM27 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM27 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM27 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM27 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36833] GAM28 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM28 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM28 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM28 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36834] GAM29 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM29 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM29 target RNA, herein schematically

represented by GAM3 TARGET RNA into GAM29 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[36835] It is appreciated that specific functions, and accordingly utilities, of GR2640 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2640 gene: GAM27 target protein, GAM28 target protein and GAM29 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM27, GAM28 and GAM29

[36836] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2641 (GR2641) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36837] GR2641 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2641 gene was detected is described hereinabove with reference to Figs. 6-15.

[36838] GR2641 gene encodes GR2641 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36839] GR2641 precursor RNA folds spatially, forming GR2641 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2641 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2641 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36840] GR2641 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM30 precursor RNA, GAM31 precursor RNA and GAM32 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36841] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM30 RNA, GAM31 RNA and GAM32 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36842] GAM30 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM30 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM30 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM30 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36843] GAM31 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM31 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM31 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM31 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36844] GAM32 RNA, herein schematically represented by GAM3 binds complimentarily to a target binding site located in an untranslated region of GAM32 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM32 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM32 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[36845] It is appreciated that specific functions, and accordingly utilities, of GR2641

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2641 gene: GAM30 target protein, GAM31 target protein and GAM32 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM30, GAM31 and GAM32

[36846] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2642(GR2642) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36847] GR2642 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2642 gene was detected is described hereinabove with reference to Figs. 6-15.

[36848] GR2642 gene encodes GR2642 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36849] GR2642 precursor RNA folds spatially, forming GR2642 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2642 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2642 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36850] GR2642 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM33 precursor RNA, GAM34 precursor RNA and GAM35 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36851] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM33 RNA, GAM34 RNA and GAM35 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36852] GAM33 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM33 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby

inhibiting translation of GAM33 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM33 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36853] GAM34 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM34 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM34 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM34 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36854] GAM35 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM35 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM35 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM35 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[36855] It is appreciated that specific functions, and accordingly utilities, of GR2642 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2642 gene: GAM33 target protein, GAM34 target protein and GAM35 target protein, herein schematically

represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM33, GAM34 and GAM35

- [36856] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2643(GR2643) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [36857] GR2643 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2643 gene was detected is described hereinabove with reference to Figs. 6-15.
- [36858] GR2643 gene encodes GR2643 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [36859] GR2643 precursor RNA folds spatially, forming GR2643 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2643 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2643 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

[36860] GR2643 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM36 precursor RNA, GAM37 precursor RNA and GAM38 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36861] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM36 RNA, GAM37 RNA and GAM38 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36862] GAM36 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM36 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM36 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM36 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36863] GAM37 RNA, herein schematically represented by GAM2 binds

complimentarily to a target binding site located in an untranslated region of GAM37 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM37 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM37 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36864] GAM38 RNA, herein schematically represented by GAM3 binds complimentarily to a target binding site located in an untranslated region of GAM38 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM38 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM38 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[36865] It is appreciated that specific functions, and accordingly utilities, of GR2643 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2643 gene: GAM36 target protein, GAM37 target protein and GAM38 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM36, GAM37 and GAM38

[36866] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2644(GR2644) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36867] GR2644 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2644 gene was detected is described hereinabove with reference to Figs. 6-15.

[36868] GR2644 gene encodes GR2644 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36869] GR2644 precursor RNA folds spatially, forming GR2644 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2644 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2644 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36870] GR2644 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM39 precursor RNA, GAM40

precursor RNA, GAM41 precursor RNA and GAM1300 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36871] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM39 RNA, GAM40 RNA, GAM41 RNA and GAM1300 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36872] GAM39 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM39 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM39 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM39 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36873] GAM40 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM40 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby

inhibiting translation of GAM40 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM40 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36874] GAM41 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM41 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM41 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM41 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[36875] GAM1300 RNA, herein schematically represented by GAM4 binds complementarily to a target binding site located in an untranslated region of GAM1300 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1300 target RNA, herein schematically represented by GAM4 TARGET RNA into GAM1300 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[36876] It is appreciated that specific functions, and accordingly utilities, of GR2644 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2644 gene: GAM39 target protein, GAM40 target protein, GAM41 target protein and GAM1300 target protein,

herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM39, GAM40, GAM41 and GAM1300

- [36877] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2645(GR2645) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [36878] GR2645 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2645 gene was detected is described hereinabove with reference to Figs. 6-15.
- [36879] GR2645 gene encodes GR2645 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [36880] GR2645 precursor RNA folds spatially, forming GR2645 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2645 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2645 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36881] GR2645 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM42 precursor RNA, GAM43 precursor RNA and GAM44 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36882] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM42 RNA, GAM43 RNA and GAM44 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36883] GAM42 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM42 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM42 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM42 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

- [36884] GAM43 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM43 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM43 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM43 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.
- [36885] GAM44 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM44 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM44 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM44 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.
- [36886] It is appreciated that specific functions, and accordingly utilities, of GR2645 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2645 gene: GAM42 target protein, GAM43 target protein and GAM44 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM42, GAM43 and GAM44

- [36887] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2646(GR2646) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [36888] GR2646 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2646 gene was detected is described hereinabove with reference to Figs. 6-15.
- [36889] GR2646 gene encodes GR2646 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [36890] GR2646 precursor RNA folds spatially, forming GR2646 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2646 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2646 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [36891] GR2646 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM45 precursor RNA and GAM46 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36892] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM45 RNA and GAM46 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36893] GAM45 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM45 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM45 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM45 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36894] GAM46 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM46 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM46 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM46 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36895] It is appreciated that specific functions, and accordingly utilities, of GR2646 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2646 gene: GAM45 target protein and GAM46 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM45 and GAM46

[36896] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2647 (GR2647) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36897] GR2647 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2647 gene was detected is described hereinabove with reference to Figs. 6-15.

[36898] GR2647 gene encodes GR2647 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36899] GR2647 precursor RNA folds spatially, forming GR2647 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2647 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2647 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36900] GR2647 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM50 precursor RNA, GAM51 precursor RNA and GAM52 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36901] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM50 RNA, GAM51 RNA and GAM52 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36902] GAM50 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM50 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM50 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM50 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36903] GAM51 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM51 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM51 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM51 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36904] GAM52 RNA, herein schematically represented by GAM3 binds complimentarily to a target binding site located in an untranslated region of GAM52 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM52 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM52 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[36905] It is appreciated that specific functions, and accordingly utilities, of GR2647

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2647 gene: GAM50 target protein, GAM51 target protein and GAM52 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM50, GAM51 and GAM52

[36906] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2648(GR2648) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36907] GR2648 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2648 gene was detected is described hereinabove with reference to Figs. 6-15.

[36908] GR2648 gene encodes GR2648 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36909] GR2648 precursor RNA folds spatially, forming GR2648 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2648 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2648 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36910] GR2648 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM58 precursor RNA and GAM59 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36911] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM58 RNA and GAM59 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36912] GAM58 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM58 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM58 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM58 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36913] GAM59 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM59 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM59 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM59 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36914] It is appreciated that specific functions, and accordingly utilities, of GR2648 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2648 gene: GAM58 target protein and GAM59 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM58 and GAM59

[36915] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2649 (GR2649) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36916] GR2649 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2649 gene was detected is described hereinabove with reference to Figs. 6-15.

[36917] GR2649 gene encodes GR2649 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36918] GR2649 precursor RNA folds spatially, forming GR2649 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2649 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2649 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36919] GR2649 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM65 precursor RNA and GAM66 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36920] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM65 RNA and GAM66 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36921] GAM65 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM65 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM65 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM65 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36922] GAM66 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM66 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM66 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM66 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36923] It is appreciated that specific functions, and accordingly utilities, of GR2649 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2649 gene: GAM65 target protein and GAM66 target protein, herein schematically represented by GAM1

TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM65 and GAM66

- [36924] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2650 (GR2650) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [36925] GR2650 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2650 gene was detected is described hereinabove with reference to Figs. 6-15.
- [36926] GR2650 gene encodes GR2650 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [36927] GR2650 precursor RNA folds spatially, forming GR2650 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2650 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2650 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [36928] GR2650 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM69 precursor RNA and GAM70 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [36929] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM69 RNA and GAM70 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [36930] GAM69 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM69 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM69 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM69 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [36931] GAM70 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM70 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM70 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM70 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36932] It is appreciated that specific functions, and accordingly utilities, of GR2650 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2650 gene: GAM69 target protein and GAM70 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM69 and GAM70

[36933] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2651 (GR2651) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36934] GR2651 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2651 gene was detected is described hereinabove with reference to Figs. 6-15.

[36935] GR2651 gene encodes GR2651 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36936] GR2651 precursor RNA folds spatially, forming GR2651 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2651 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2651 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36937] GR2651 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM71 precursor RNA and GAM72 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36938] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM71 RNA and GAM72 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36939] GAM71 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM71 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM71 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM71 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36940] GAM72 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM72 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM72 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM72 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36941] It is appreciated that specific functions, and accordingly utilities, of GR2651 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2651 gene: GAM71 target protein and GAM72 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM71 and GAM72

[36942] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record

2652(GR2652) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36943] GR2652 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2652 gene was detected is described hereinabove with reference to Figs. 6-15.

[36944] GR2652 gene encodes GR2652 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36945] GR2652 precursor RNA folds spatially, forming GR2652 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2652 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2652 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36946] GR2652 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM79 precursor RNA and

GAM80 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36947] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM79 RNA and GAM80 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36948] GAM79 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM79 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM79 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM79 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36949] GAM80 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM80 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM80 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM80 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36950] It is appreciated that specific functions, and accordingly utilities, of GR2652 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2652 gene: GAM79 target protein and GAM80 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM79 and GAM80

[36951] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2653 (GR2653) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36952] GR2653 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2653 gene was detected is described hereinabove with reference to Figs. 6-15.

[36953] GR2653 gene encodes GR2653 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36954] GR2653 precursor RNA folds spatially, forming GR2653 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2653 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2653 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36955] GR2653 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM82 precursor RNA and GAM83 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36956] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM82 RNA and GAM83 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36957] GAM82 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM82 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM82 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM82 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36958] GAM83 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM83 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM83 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM83 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36959] It is appreciated that specific functions, and accordingly utilities, of GR2653 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2653 gene: GAM82 target protein and GAM83 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM82 and GAM83

[36960] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2654(GR2654) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[36961] GR2654 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2654 gene was detected is described hereinabove with reference to Figs. 6-15.

[36962] GR2654 gene encodes GR2654 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36963] GR2654 precursor RNA folds spatially, forming GR2654 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2654 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2654 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36964] GR2654 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM87 precursor RNA and GAM88 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

## GAM PRECURSOR RNA of Fig. 8.

[36965] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM87 RNA and GAM88 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36966] GAM87 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM87 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM87 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM87 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36967] GAM88 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM88 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM88 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM88 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36968] It is appreciated that specific functions, and accordingly utilities, of GR2654 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2654 gene: GAM87 target protein and GAM88 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM87 and GAM88

[36969] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2655 (GR2655) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36970] GR2655 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2655 gene was detected is described hereinabove with reference to Figs. 6-15.

[36971] GR2655 gene encodes GR2655 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36972] GR2655 precursor RNA folds spatially, forming GR2655 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2655 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2655 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36973] GR2655 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM89 precursor RNA and GAM90 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36974] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM89 RNA and GAM90 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36975] GAM89 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM89 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM89 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM89 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36976] GAM90 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM90 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM90 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM90 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36977] It is appreciated that specific functions, and accordingly utilities, of GR2655 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2655 gene: GAM89 target protein and GAM90 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM89 and GAM90

[36978] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2656 (GR2656) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36979] GR2656 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2656 gene was detected is described hereinabove with reference to Figs. 6-15.

[36980] GR2656 gene encodes GR2656 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[36981] GR2656 precursor RNA folds spatially, forming GR2656 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2656 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2656 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[36982] GR2656 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM91 precursor RNA and GAM92 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[36983] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM91 RNA and GAM92 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[36984] GAM91 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM91 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM91 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM91 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[36985] GAM92 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM92 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM92 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM92 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36986] It is appreciated that specific functions, and accordingly utilities, of GR2656 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2656 gene: GAM91 target protein and GAM92 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function

of these target genes is elaborated hereinabove with reference to GAM91 and GAM92

- [36987] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2657(GR2657) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [36988] GR2657 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2657 gene was detected is described hereinabove with reference to Figs. 6-15.
- [36989] GR2657 gene encodes GR2657 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [36990] GR2657 precursor RNA folds spatially, forming GR2657 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2657 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2657 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [36991] GR2657 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM96 precursor RNA, GAM97 precursor RNA and GAM98 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [36992] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM96 RNA, GAM97 RNA and GAM98 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [36993] GAM96 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM96 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM96 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM96 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [36994] GAM97 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM97 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM97 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM97 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[36995] GAM98 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM98 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM98 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM98 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[36996] It is appreciated that specific functions, and accordingly utilities, of GR2657 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2657 gene: GAM96 target protein, GAM97 target protein and GAM98 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM96, GAM97 and GAM98

[36997] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2658(GR2658) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[36998] GR2658 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2658 gene was detected is described hereinabove with reference to Figs. 6-15.

[36999] GR2658 gene encodes GR2658 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37000] GR2658 precursor RNA folds spatially, forming GR2658 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2658 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2658 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37001] GR2658 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM106 precursor RNA and GAM107 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37002] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM106 RNA and GAM107 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37003] GAM106 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM106 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM106 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM106 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37004] GAM107 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM107 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM107 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM107 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37005] It is appreciated that specific functions, and accordingly utilities, of GR2658 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2658 gene: GAM106 target protein and GAM107 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM106 and GAM107

[37006] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2659 (GR2659) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37007] GR2659 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2659 gene was detected is described hereinabove with reference to Figs. 6-15.

[37008] GR2659 gene encodes GR2659 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37009] GR2659 precursor RNA folds spatially, forming GR2659 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2659 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2659 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37010] GR2659 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM111 precursor RNA and GAM112 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37011] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM111 RNA and GAM112 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37012] GAM111 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM111 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM111 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM111 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37013] GAM112 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM112 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM112 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM112 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37014] It is appreciated that specific functions, and accordingly utilities, of GR2659 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2659 gene: GAM111 target protein and GAM112 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM111 and GAM112

[37015] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2660 (GR2660) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

- [37016] GR2660 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2660 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37017] GR2660 gene encodes GR2660 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37018] GR2660 precursor RNA folds spatially, forming GR2660 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2660 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2660 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [37019] GR2660 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM113 precursor RNA and GAM114 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37020] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM113 RNA and GAM114 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37021] GAM113 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM113 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM113 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM113 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37022] GAM114 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM114 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM114 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM114 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37023] It is appreciated that specific functions, and accordingly utilities, of GR2660 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2660 gene: GAM113 target

protein and GAM114 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM113 and GAM114

[37024] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2661 (GR2661) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37025] GR2661 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2661 gene was detected is described hereinabove with reference to Figs. 6-15.

[37026] GR2661 gene encodes GR2661 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37027] GR2661 precursor RNA folds spatially, forming GR2661 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2661 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2661 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37028] GR2661 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM122 precursor RNA and GAM123 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37029] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM122 RNA and GAM123 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37030] GAM122 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM122 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM122 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM122 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37031] GAM123 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM123 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM123 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM123 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37032] It is appreciated that specific functions, and accordingly utilities, of GR2661 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2661 gene: GAM122 target protein and GAM123 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM122 and GAM123

[37033] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2662 (GR2662) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37034] GR2662 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2662 gene was detected is described hereinabove with reference to Figs. 6-15.

[37035] GR2662 gene encodes GR2662 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37036] GR2662 precursor RNA folds spatially, forming GR2662 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2662 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2662 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37037] GR2662 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM128 precursor RNA and GAM129 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37038] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM128 RNA and GAM129 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37039] GAM128 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM128 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM128 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM128 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37040] GAM129 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM129 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM129 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM129 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37041] It is appreciated that specific functions, and accordingly utilities, of GR2662 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2662 gene: GAM128 target protein and GAM129 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM128 and GAM129

- [37042] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2663(GR2663) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37043] GR2663 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2663 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37044] GR2663 gene encodes GR2663 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37045] GR2663 precursor RNA folds spatially, forming GR2663 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2663 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2663 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [37046] GR2663 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM131 precursor RNA and GAM132 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37047] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM131 RNA and GAM132 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37048] GAM131 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM131 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM131 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM131 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37049] GAM132 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM132 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM132 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM132 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37050] It is appreciated that specific functions, and accordingly utilities, of GR2663 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2663 gene: GAM131 target protein and GAM132 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM131 and GAM132

[37051] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2664 (GR2664) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37052] GR2664 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2664 gene was detected is described hereinabove with reference to Figs. 6-15.

[37053] GR2664 gene encodes GR2664 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37054] GR2664 precursor RNA folds spatially, forming GR2664 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2664 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2664 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37055] GR2664 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM133 precursor RNA and GAM134 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37056] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM133 RNA and GAM134 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37057] GAM133 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM133 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM133 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM133 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37058] GAM134 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM134 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM134 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM134 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37059] It is appreciated that specific functions, and accordingly utilities, of GR2664 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2664 gene: GAM133 target protein and GAM134 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM133 and GAM134

[37060] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2665(GR2665) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37061] GR2665 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2665 gene was detected is described hereinabove with reference to Figs. 6-15.

[37062] GR2665 gene encodes GR2665 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37063] GR2665 precursor RNA folds spatially, forming GR2665 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2665 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2665 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37064] GR2665 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM142 precursor RNA and GAM143 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37065] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM142 RNA and GAM143 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37066] GAM142 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM142 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM142 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM142 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37067] GAM143 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM143 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM143 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM143 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37068] It is appreciated that specific functions, and accordingly utilities, of GR2665

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2665 gene: GAM142 target protein and GAM143 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM142 and GAM143

[37069] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2666 (GR2666) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37070] GR2666 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2666 gene was detected is described hereinabove with reference to Figs. 6-15.

[37071] GR2666 gene encodes GR2666 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37072] GR2666 precursor RNA folds spatially, forming GR2666 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2666 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2666 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37073] GR2666 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM148 precursor RNA and GAM149 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37074] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM148 RNA and GAM149 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37075] GAM148 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM148 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM148 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM148 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37076] GAM149 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM149 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM149 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM149 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37077] It is appreciated that specific functions, and accordingly utilities, of GR2666 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2666 gene: GAM148 target protein and GAM149 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM148 and GAM149

[37078] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2667 (GR2667) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37079] GR2667 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2667 gene was detected is described hereinabove with reference to Figs. 6-15.

[37080] GR2667 gene encodes GR2667 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37081] GR2667 precursor RNA folds spatially, forming GR2667 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2667 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2667 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37082] GR2667 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM152 precursor RNA and GAM153 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37083] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM152 RNA and GAM153 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37084] GAM152 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM152 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM152 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM152 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37085] GAM153 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM153 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM153 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM153 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37086] It is appreciated that specific functions, and accordingly utilities, of GR2667 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2667 gene: GAM152 target protein and GAM153 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM152 and GAM153

[37087] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2668 (GR2668) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37088] GR2668 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2668 gene was detected is described hereinabove with reference to Figs. 6-15.

[37089] GR2668 gene encodes GR2668 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37090] GR2668 precursor RNA folds spatially, forming GR2668 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2668 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2668 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [37091] GR2668 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM159 precursor RNA and GAM160 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37092] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM159 RNA and GAM160 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37093] GAM159 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM159 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM159 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM159 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37094] GAM160 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM160 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM160 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM160 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37095] It is appreciated that specific functions, and accordingly utilities, of GR2668 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2668 gene: GAM159 target protein and GAM160 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM159 and GAM160

[37096] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2669 (GR2669) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37097] GR2669 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2669 gene was detected is described hereinabove with reference to Figs. 6-15.

[37098] GR2669 gene encodes GR2669 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37099] GR2669 precursor RNA folds spatially, forming GR2669 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2669 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2669 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37100] GR2669 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM163 precursor RNA and GAM164 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37101] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM163 RNA and GAM164 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37102] GAM163 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM163 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM163 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM163 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37103] GAM164 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM164 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM164 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM164 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37104] It is appreciated that specific functions, and accordingly utilities, of GR2669 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2669 gene: GAM163 target protein and GAM164 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM163 and GAM164

[37105] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2670 (GR2670) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37106] GR2670 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2670 gene was detected is described hereinabove with reference to Figs. 6-15.

[37107] GR2670 gene encodes GR2670 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37108] GR2670 precursor RNA folds spatially, forming GR2670 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2670 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2670 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37109] GR2670 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM170 precursor RNA and

GAM171 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37110] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM170 RNA and GAM171 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37111] GAM170 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM170 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM170 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM170 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37112] GAM171 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM171 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM171 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM171 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37113] It is appreciated that specific functions, and accordingly utilities, of GR2670 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2670 gene: GAM170 target protein and GAM171 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM170 and GAM171

[37114] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2671 (GR2671) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37115] GR2671 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2671 gene was detected is described hereinabove with reference to Figs. 6-15.

[37116] GR2671 gene encodes GR2671 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37117] GR2671 precursor RNA folds spatially, forming GR2671 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2671 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2671 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37118] GR2671 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM174 precursor RNA, GAM175 precursor RNA and GAM176 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37119] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM174 RNA, GAM175 RNA and GAM176 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37120] GAM174 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM174 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM174 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM174 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37121] GAM175 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM175 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM175 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM175 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37122] GAM176 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM176 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM176 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM176 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[37123] It is appreciated that specific functions, and accordingly utilities, of GR2671 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2671 gene: GAM174 target protein, GAM175 target protein and GAM176 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM174, GAM175 and GAM176

[37124] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2672 (GR2672) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37125] GR2672 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2672 gene was detected is described hereinabove with reference to Figs. 6-15.

[37126] GR2672 gene encodes GR2672 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37127] GR2672 precursor RNA folds spatially, forming GR2672 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2672 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2672 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37128] GR2672 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM178 precursor RNA and GAM179 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37129] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM178 RNA and GAM179 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37130] GAM178 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM178 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM178 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM178 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37131] GAM179 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM179 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM179 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM179 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37132] It is appreciated that specific functions, and accordingly utilities, of GR2672 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2672 gene: GAM178 target protein and GAM179 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM178 and GAM179

[37133] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2673 (GR2673) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37134] GR2673 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2673 gene was detected is described hereinabove with reference to Figs. 6-15.

[37135] GR2673 gene encodes GR2673 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37136] GR2673 precursor RNA folds spatially, forming GR2673 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2673 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2673 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37137] GR2673 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM181 precursor RNA and GAM182 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37138] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM181 RNA and GAM182 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37139] GAM181 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM181 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM181 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM181 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37140] GAM182 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM182 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM182 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM182 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37141] It is appreciated that specific functions, and accordingly utilities, of GR2673 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2673 gene: GAM181 target protein and GAM182 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM181 and GAM182

[37142] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2674 (GR2674) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37143] GR2674 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2674 gene was detected is described hereinabove with reference to Figs. 6-15.

[37144] GR2674 gene encodes GR2674 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37145] GR2674 precursor RNA folds spatially, forming GR2674 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2674 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2674 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37146] GR2674 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM186 precursor RNA and GAM187 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37147] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM186 RNA and GAM187 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37148] GAM186 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM186 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM186 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM186 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37149] GAM187 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM187 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM187 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM187 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37150] It is appreciated that specific functions, and accordingly utilities, of GR2674 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2674 gene: GAM186 target protein and GAM187 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM186 and GAM187

[37151] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2675 (GR2675) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37152] GR2675 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2675 gene was detected is described hereinabove with reference to Figs. 6-15.

[37153] GR2675 gene encodes GR2675 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[37154] GR2675 precursor RNA folds spatially, forming GR2675 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2675 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2675 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37155] GR2675 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM200 precursor RNA and GAM201 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37156] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM200 RNA and GAM201 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37157] GAM200 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM200 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM200 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM200 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37158] GAM201 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM201 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM201 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM201 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37159] It is appreciated that specific functions, and accordingly utilities, of GR2675 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2675 gene: GAM200 target protein and GAM201 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM200 and GAM201

[37160] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2676(GR2676) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37161] GR2676 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2676 gene was detected is described hereinabove with reference to Figs. 6-15.

[37162] GR2676 gene encodes GR2676 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37163] GR2676 precursor RNA folds spatially, forming GR2676 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2676 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2676 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37164] GR2676 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM203 precursor RNA and GAM204 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37165] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM203 RNA and GAM204 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37166] GAM203 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM203 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM203 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM203 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37167] GAM204 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM204 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM204 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM204 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37168] It is appreciated that specific functions, and accordingly utilities, of GR2676 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2676 gene: GAM203 target protein and GAM204 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM203 and GAM204

[37169] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2677 (GR2677) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37170] GR2677 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2677 gene was detected is described hereinabove with reference to Figs. 6-15.

[37171] GR2677 gene encodes GR2677 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37172] GR2677 precursor RNA folds spatially, forming GR2677 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2677 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2677 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37173] GR2677 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM206 precursor RNA, GAM207 precursor RNA, GAM208 precursor RNA and GAM209 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37174] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM206 RNA, GAM207 RNA, GAM208 RNA and GAM209 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37175] GAM206 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM206 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM206 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM206 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37176] GAM207 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM207 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM207 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM207 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37177] GAM208 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM208 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM208 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM208 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[37178] GAM209 RNA, herein schematically represented by GAM4 binds complementarily to a target binding site located in an untranslated region of GAM209 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM209 target RNA, herein schematically represented by GAM4 TARGET RNA into GAM209 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[37179] It is appreciated that specific functions, and accordingly utilities, of GR2677 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2677 gene: GAM206 target protein, GAM207 target protein, GAM208 target protein and GAM209 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM206, GAM207, GAM208 and GAM209

[37180] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2678 (GR2678) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37181] GR2678 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2678 gene was detected is described hereinabove with reference to Figs. 6-15.

[37182] GR2678 gene encodes GR2678 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37183] GR2678 precursor RNA folds spatially, forming GR2678 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2678 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2678 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37184] GR2678 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM211 precursor RNA and GAM212 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37185] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM211 RNA and GAM212 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37186] GAM211 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM211 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM211 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM211 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37187] GAM212 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM212 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM212 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM212 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37188] It is appreciated that specific functions, and accordingly utilities, of GR2678 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2678 gene: GAM211 target protein and GAM212 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM211 and GAM212

[37189] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2679(GR2679) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37190] GR2679 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2679 gene was detected is described hereinabove with reference to Figs. 6-15.

[37191] GR2679 gene encodes GR2679 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37192] GR2679 precursor RNA folds spatially, forming GR2679 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2679 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2679 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37193] GR2679 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM214 precursor RNA and

GAM215 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37194] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM214 RNA and GAM215 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37195] GAM214 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM214 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM214 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM214 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37196] GAM215 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM215 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM215 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM215 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37197] It is appreciated that specific functions, and accordingly utilities, of GR2679 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2679 gene: GAM214 target protein and GAM215 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM214 and GAM215

[37198] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2680 (GR2680) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37199] GR2680 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2680 gene was detected is described hereinabove with reference to Figs. 6-15.

[37200] GR2680 gene encodes GR2680 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37201] GR2680 precursor RNA folds spatially, forming GR2680 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2680 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2680 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37202] GR2680 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM221 precursor RNA, GAM222 precursor RNA and GAM223 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37203] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM221 RNA, GAM222 RNA and GAM223 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37204] GAM221 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM221 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM221 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM221 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37205] GAM222 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM222 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM222 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM222 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37206] GAM223 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM223 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM223 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM223 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[37207] It is appreciated that specific functions, and accordingly utilities, of GR2680 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2680 gene: GAM221 target protein, GAM222 target protein and GAM223 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM221, GAM222 and GAM223

[37208] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2681 (GR2681) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37209] GR2681 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2681 gene was detected is described hereinabove with reference to Figs. 6-15.

[37210] GR2681 gene encodes GR2681 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37211] GR2681 precursor RNA folds spatially, forming GR2681 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2681 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2681 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [37212] GR2681 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM226 precursor RNA and GAM227 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37213] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM226 RNA and GAM227 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37214] GAM226 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM226 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM226 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM226 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37215] GAM227 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM227 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM227 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM227 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37216] It is appreciated that specific functions, and accordingly utilities, of GR2681 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2681 gene: GAM226 target protein and GAM227 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM226 and GAM227

[37217] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2682 (GR2682) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37218] GR2682 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2682 gene was detected is described hereinabove with reference to Figs. 6-15.

[37219] GR2682 gene encodes GR2682 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37220] GR2682 precursor RNA folds spatially, forming GR2682 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2682 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2682 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37221] GR2682 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM234 precursor RNA and GAM235 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37222] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM234 RNA and GAM235 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37223] GAM234 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM234 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM234 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM234 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37224] GAM235 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM235 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM235 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM235 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37225] It is appreciated that specific functions, and accordingly utilities, of GR2682 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2682 gene: GAM234 target protein and GAM235 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM234 and GAM235

- [37226] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2683 (GR2683) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37227] GR2683 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2683 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37228] GR2683 gene encodes GR2683 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37229] GR2683 precursor RNA folds spatially, forming GR2683 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2683 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2683 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [37230] GR2683 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM236 precursor RNA and GAM237 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37231] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM236 RNA and GAM237 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37232] GAM236 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM236 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM236 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM236 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37233] GAM237 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM237 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM237 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM237 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37234] It is appreciated that specific functions, and accordingly utilities, of GR2683 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2683 gene: GAM236 target protein and GAM237 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM236 and GAM237

[37235] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2684 (GR2684) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37236] GR2684 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2684 gene was detected is described hereinabove with reference to Figs. 6-15.

[37237] GR2684 gene encodes GR2684 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[37238] GR2684 precursor RNA folds spatially, forming GR2684 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2684 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2684 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37239] GR2684 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM244 precursor RNA, GAM245 precursor RNA and GAM246 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37240] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM244 RNA, GAM245 RNA and GAM246 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37241] GAM244 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM244 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM244 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM244 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37242] GAM245 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM245 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM245 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM245 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37243] GAM246 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM246 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM246 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM246 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[37244] It is appreciated that specific functions, and accordingly utilities, of GR2684 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2684 gene: GAM244 target protein, GAM245 target protein and GAM246 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM244, GAM245 and GAM246

[37245] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2685 (GR2685) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37246] GR2685 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2685 gene was detected is described hereinabove with reference to Figs. 6-15.

[37247] GR2685 gene encodes GR2685 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37248] GR2685 precursor RNA folds spatially, forming GR2685 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2685 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2685 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37249] GR2685 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM250 precursor RNA and GAM251 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37250] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM250 RNA and GAM251 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37251] GAM250 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM250 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM250 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM250 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37252] GAM251 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM251 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM251 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM251 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37253] It is appreciated that specific functions, and accordingly utilities, of GR2685 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2685 gene: GAM250 target protein and GAM251 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM250 and GAM251

[37254] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2686 (GR2686) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37255] GR2686 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2686 gene was detected is described hereinabove with reference to Figs. 6-15.

[37256] GR2686 gene encodes GR2686 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37257] GR2686 precursor RNA folds spatially, forming GR2686 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2686 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2686 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37258] GR2686 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM252 precursor RNA and GAM253 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37259] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM252 RNA and GAM253 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37260] GAM252 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM252 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM252 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM252 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37261] GAM253 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM253 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM253 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM253 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37262] It is appreciated that specific functions, and accordingly utilities, of GR2686 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2686 gene: GAM252 target

protein and GAM253 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM252 and GAM253

[37263] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2687 (GR2687) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37264] GR2687 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2687 gene was detected is described hereinabove with reference to Figs. 6-15.

[37265] GR2687 gene encodes GR2687 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37266] GR2687 precursor RNA folds spatially, forming GR2687 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2687 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2687 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37267] GR2687 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM257 precursor RNA and GAM258 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37268] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM257 RNA and GAM258 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37269] GAM257 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM257 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM257 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM257 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37270] GAM258 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM258 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM258 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM258 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37271] It is appreciated that specific functions, and accordingly utilities, of GR2687 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2687 gene: GAM257 target protein and GAM258 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM257 and GAM258

[37272] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2688 (GR2688) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37273] GR2688 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2688 gene was detected is described hereinabove with reference to Figs. 6-15.

[37274] GR2688 gene encodes GR2688 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37275] GR2688 precursor RNA folds spatially, forming GR2688 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2688 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2688 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37276] GR2688 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM261 precursor RNA and GAM262 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37277] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM261 RNA and GAM262 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37278] GAM261 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM261 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM261 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM261 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37279] GAM262 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM262 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM262 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM262 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37280] It is appreciated that specific functions, and accordingly utilities, of GR2688 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2688 gene: GAM261 target protein and GAM262 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM261 and GAM262

- [37281] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2689 (GR2689) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37282] GR2689 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2689 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37283] GR2689 gene encodes GR2689 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37284] GR2689 precursor RNA folds spatially, forming GR2689 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2689 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2689 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [37285] GR2689 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM263 precursor RNA and GAM264 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37286] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM263 RNA and GAM264 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37287] GAM263 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM263 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM263 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM263 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37288] GAM264 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM264 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM264 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM264 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37289] It is appreciated that specific functions, and accordingly utilities, of GR2689 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2689 gene: GAM263 target protein and GAM264 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM263 and GAM264

[37290] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2690 (GR2690) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37291] GR2690 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2690 gene was detected is described hereinabove with reference to Figs. 6-15.

[37292] GR2690 gene encodes GR2690 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37293] GR2690 precursor RNA folds spatially, forming GR2690 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2690 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2690 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37294] GR2690 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM265 precursor RNA and GAM266 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37295] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM265 RNA and GAM266 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37296] GAM265 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM265 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM265 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM265 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37297] GAM266 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM266 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM266 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM266 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37298] It is appreciated that specific functions, and accordingly utilities, of GR2690 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2690 gene: GAM265 target protein and GAM266 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM265 and GAM266

[37299] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2691 (GR2691) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37300] GR2691 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2691 gene was detected is described hereinabove with reference to Figs. 6-15.

[37301] GR2691 gene encodes GR2691 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37302] GR2691 precursor RNA folds spatially, forming GR2691 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2691 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2691 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37303] GR2691 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM271 precursor RNA and GAM272 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37304] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM271 RNA and GAM272 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37305] GAM271 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM271 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM271 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM271 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37306] GAM272 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM272 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM272 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM272 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37307] It is appreciated that specific functions, and accordingly utilities, of GR2691

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2691 gene: GAM271 target protein and GAM272 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM271 and GAM272

[37308] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2692 (GR2692) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37309] GR2692 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2692 gene was detected is described hereinabove with reference to Figs. 6-15.

[37310] GR2692 gene encodes GR2692 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37311] GR2692 precursor RNA folds spatially, forming GR2692 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2692 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2692 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37312] GR2692 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM276 precursor RNA and GAM277 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37313] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM276 RNA and GAM277 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37314] GAM276 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM276 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM276 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM276 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37315] GAM277 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM277 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM277 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM277 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37316] It is appreciated that specific functions, and accordingly utilities, of GR2692 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2692 gene: GAM276 target protein and GAM277 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM276 and GAM277

[37317] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2693 (GR2693) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37318] GR2693 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2693 gene was detected is described hereinabove with reference to Figs. 6-15.

[37319] GR2693 gene encodes GR2693 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37320] GR2693 precursor RNA folds spatially, forming GR2693 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2693 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2693 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37321] GR2693 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM282 precursor RNA and GAM283 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37322] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM282 RNA and GAM283 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37323] GAM282 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM282 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM282 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM282 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37324] GAM283 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM283 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM283 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM283 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37325] It is appreciated that specific functions, and accordingly utilities, of GR2693 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2693 gene: GAM282 target protein and GAM283 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM282 and GAM283

[37326] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2694 (GR2694) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37327] GR2694 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2694 gene was detected is described hereinabove with reference to Figs. 6-15.

[37328] GR2694 gene encodes GR2694 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37329] GR2694 precursor RNA folds spatially, forming GR2694 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2694 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2694 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [37330] GR2694 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM287 precursor RNA and GAM288 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37331] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM287 RNA and GAM288 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37332] GAM287 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM287 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM287 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM287 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37333] GAM288 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM288 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM288 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM288 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37334] It is appreciated that specific functions, and accordingly utilities, of GR2694 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2694 gene: GAM287 target protein and GAM288 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM287 and GAM288

[37335] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2695 (GR2695) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37336] GR2695 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2695 gene was detected is described hereinabove with reference to Figs. 6-15.

[37337] GR2695 gene encodes GR2695 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37338] GR2695 precursor RNA folds spatially, forming GR2695 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2695 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2695 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37339] GR2695 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM292 precursor RNA and GAM293 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37340] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM292 RNA and GAM293 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37341] GAM292 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM292 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM292 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM292 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37342] GAM293 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM293 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM293 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM293 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37343] It is appreciated that specific functions, and accordingly utilities, of GR2695 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2695 gene: GAM292 target protein and GAM293 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM292 and GAM293

[37344] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2696(GR2696) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37345] GR2696 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2696 gene was detected is described hereinabove with reference to Figs. 6-15.

[37346] GR2696 gene encodes GR2696 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37347] GR2696 precursor RNA folds spatially, forming GR2696 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2696 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2696 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37348] GR2696 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM299 precursor RNA and

GAM300 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37349] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM299 RNA and GAM300 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37350] GAM299 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM299 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM299 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM299 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37351] GAM300 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM300 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM300 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM300 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37352] It is appreciated that specific functions, and accordingly utilities, of GR2696 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2696 gene: GAM299 target protein and GAM300 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM299 and GAM300

[37353] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2697 (GR2697) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37354] GR2697 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2697 gene was detected is described hereinabove with reference to Figs. 6-15.

[37355] GR2697 gene encodes GR2697 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37356] GR2697 precursor RNA folds spatially, forming GR2697 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2697 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2697 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37357] GR2697 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM303 precursor RNA and GAM304 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37358] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM303 RNA and GAM304 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37359] GAM303 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM303 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM303 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM303 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37360] GAM304 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM304 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM304 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM304 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37361] It is appreciated that specific functions, and accordingly utilities, of GR2697 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2697 gene: GAM303 target protein and GAM304 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM303 and GAM304

[37362] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2698 (GR2698) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[37363] GR2698 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2698 gene was detected is described hereinabove with reference to Figs. 6-15.

[37364] GR2698 gene encodes GR2698 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37365] GR2698 precursor RNA folds spatially, forming GR2698 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2698 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2698 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37366] GR2698 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM305 precursor RNA and GAM306 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

GAM PRECURSOR RNA of Fig. 8.

[37367] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM305 RNA and GAM306 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37368] GAM305 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM305 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM305 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM305 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37369] GAM306 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM306 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM306 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM306 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37370] It is appreciated that specific functions, and accordingly utilities, of GR2698 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2698 gene: GAM305 target protein and GAM306 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM305 and GAM306

[37371] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2699 (GR2699) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37372] GR2699 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2699 gene was detected is described hereinabove with reference to Figs. 6-15.

[37373] GR2699 gene encodes GR2699 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37374] GR2699 precursor RNA folds spatially, forming GR2699 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2699 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2699 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [37375] GR2699 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM319 precursor RNA and GAM320 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37376] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM319 RNA and GAM320 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37377] GAM319 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM319 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM319 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM319 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37378] GAM320 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM320 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM320 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM320 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37379] It is appreciated that specific functions, and accordingly utilities, of GR2699 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2699 gene: GAM319 target protein and GAM320 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM319 and GAM320

[37380] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2700 (GR2700) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37381] GR2700 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2700 gene was detected is described hereinabove with reference to Figs. 6-15.

[37382] GR2700 gene encodes GR2700 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37383] GR2700 precursor RNA folds spatially, forming GR2700 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2700 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2700 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37384] GR2700 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM321 precursor RNA and GAM322 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37385] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM321 RNA and GAM322 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37386] GAM321 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM321 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM321 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM321 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37387] GAM322 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM322 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM322 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM322 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37388] It is appreciated that specific functions, and accordingly utilities, of GR2700 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2700 gene: GAM321 target protein and GAM322 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM321 and GAM322

- [37389] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2701 (GR2701) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37390] GR2701 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2701 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37391] GR2701 gene encodes GR2701 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37392] GR2701 precursor RNA folds spatially, forming GR2701 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2701 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2701 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [37393] GR2701 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM324 precursor RNA and GAM325 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37394] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM324 RNA and GAM325 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37395] GAM324 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM324 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM324 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM324 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37396] GAM325 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM325 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM325 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM325 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37397] It is appreciated that specific functions, and accordingly utilities, of GR2701 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2701 gene: GAM324 target protein and GAM325 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM324 and GAM325

[37398] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2702 (GR2702) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37399] GR2702 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2702 gene was detected is described hereinabove with reference to Figs. 6-15.

[37400] GR2702 gene encodes GR2702 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[37401] GR2702 precursor RNA folds spatially, forming GR2702 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2702 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2702 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37402] GR2702 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM342 precursor RNA and GAM343 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37403] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM342 RNA and GAM343 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37404] GAM342 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM342 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM342 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM342 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37405] GAM343 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM343 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM343 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM343 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37406] It is appreciated that specific functions, and accordingly utilities, of GR2702 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2702 gene: GAM342 target protein and GAM343 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM342 and GAM343

[37407] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2703(GR2703) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37408] GR2703 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2703 gene was detected is described hereinabove with reference to Figs. 6-15.

[37409] GR2703 gene encodes GR2703 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37410] GR2703 precursor RNA folds spatially, forming GR2703 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2703 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2703 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37411] GR2703 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM352 precursor RNA and GAM353 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37412] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM352 RNA and GAM353 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37413] GAM352 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM352 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM352 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM352 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37414] GAM353 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM353 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM353 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM353 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37415] It is appreciated that specific functions, and accordingly utilities, of GR2703 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2703 gene: GAM352 target protein and GAM353 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM352 and GAM353

[37416] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2704 (GR2704) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37417] GR2704 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2704 gene was detected is described hereinabove with reference to Figs. 6-15.

[37418] GR2704 gene encodes GR2704 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37419] GR2704 precursor RNA folds spatially, forming GR2704 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2704 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2704 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37420] GR2704 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM354 precursor RNA and GAM355 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37421] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM354 RNA and GAM355 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37422] GAM354 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM354 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM354 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM354 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37423] GAM355 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM355 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM355 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM355 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37424] It is appreciated that specific functions, and accordingly utilities, of GR2704 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2704 gene: GAM354 target protein and GAM355 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM354 and GAM355

[37425] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2705 (GR2705) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

- [37426] GR2705 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2705 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37427] GR2705 gene encodes GR2705 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37428] GR2705 precursor RNA folds spatially, forming GR2705 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2705 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2705 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [37429] GR2705 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM368 precursor RNA and GAM369 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37430] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM368 RNA and GAM369 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37431] GAM368 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM368 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM368 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM368 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37432] GAM369 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM369 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM369 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM369 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37433] It is appreciated that specific functions, and accordingly utilities, of GR2705 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2705 gene: GAM368 target

protein and GAM369 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM368 and GAM369

[37434] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2706 (GR2706) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37435] GR2706 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2706 gene was detected is described hereinabove with reference to Figs. 6-15.

[37436] GR2706 gene encodes GR2706 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37437] GR2706 precursor RNA folds spatially, forming GR2706 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2706 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2706 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37438] GR2706 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM372 precursor RNA and GAM373 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37439] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM372 RNA and GAM373 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37440] GAM372 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM372 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM372 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM372 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37441] GAM373 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM373 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM373 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM373 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37442] It is appreciated that specific functions, and accordingly utilities, of GR2706 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2706 gene: GAM372 target protein and GAM373 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM372 and GAM373

[37443] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2707 (GR2707) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37444] GR2707 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2707 gene was detected is described hereinabove with reference to Figs. 6-15.

[37445] GR2707 gene encodes GR2707 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37446] GR2707 precursor RNA folds spatially, forming GR2707 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2707 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2707 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37447] GR2707 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM401 precursor RNA and GAM402 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37448] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM401 RNA and GAM402 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37449] GAM401 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM401 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM401 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM401 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37450] GAM402 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM402 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM402 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM402 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37451] It is appreciated that specific functions, and accordingly utilities, of GR2707 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2707 gene: GAM401 target protein and GAM402 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM401 and GAM402

- [37452] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2708(GR2708) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37453] GR2708 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2708 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37454] GR2708 gene encodes GR2708 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37455] GR2708 precursor RNA folds spatially, forming GR2708 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2708 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2708 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [37456] GR2708 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM407 precursor RNA and GAM408 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37457] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM407 RNA and GAM408 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37458] GAM407 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM407 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM407 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM407 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37459] GAM408 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM408 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM408 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM408 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37460] It is appreciated that specific functions, and accordingly utilities, of GR2708 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2708 gene: GAM407 target protein and GAM408 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM407 and GAM408

[37461] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2709 (GR2709) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37462] GR2709 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2709 gene was detected is described hereinabove with reference to Figs. 6-15.

[37463] GR2709 gene encodes GR2709 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37464] GR2709 precursor RNA folds spatially, forming GR2709 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2709 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2709 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37465] GR2709 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM413 precursor RNA and GAM414 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37466] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM413 RNA and GAM414 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37467] GAM413 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM413 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM413 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM413 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37468] GAM414 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM414 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM414 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM414 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37469] It is appreciated that specific functions, and accordingly utilities, of GR2709 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2709 gene: GAM413 target protein and GAM414 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM413 and GAM414

[37470] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2710(GR2710) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37471] GR2710 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2710 gene was detected is described hereinabove with reference to Figs. 6-15.

[37472] GR2710 gene encodes GR2710 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37473] GR2710 precursor RNA folds spatially, forming GR2710 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2710 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2710 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37474] GR2710 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM416 precursor RNA and GAM417 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37475] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM416 RNA and GAM417 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37476] GAM416 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM416 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM416 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM416 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37477] GAM417 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM417 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM417 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM417 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37478] It is appreciated that specific functions, and accordingly utilities, of GR2710

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2710 gene: GAM416 target protein and GAM417 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM416 and GAM417

[37479] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2711 (GR2711) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37480] GR2711 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2711 gene was detected is described hereinabove with reference to Figs. 6-15.

[37481] GR2711 gene encodes GR2711 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37482] GR2711 precursor RNA folds spatially, forming GR2711 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2711 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2711 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37483] GR2711 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM428 precursor RNA and GAM429 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37484] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM428 RNA and GAM429 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37485] GAM428 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM428 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM428 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM428 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37486] GAM429 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM429 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM429 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM429 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37487] It is appreciated that specific functions, and accordingly utilities, of GR2711 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2711 gene: GAM428 target protein and GAM429 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM428 and GAM429

[37488] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2712(GR2712) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37489] GR2712 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2712 gene was detected is described hereinabove with reference to Figs. 6-15.

[37490] GR2712 gene encodes GR2712 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37491] GR2712 precursor RNA folds spatially, forming GR2712 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2712 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2712 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37492] GR2712 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM431 precursor RNA and GAM432 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37493] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM431 RNA and GAM432 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37494] GAM431 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM431 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM431 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM431 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37495] GAM432 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM432 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM432 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM432 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37496] It is appreciated that specific functions, and accordingly utilities, of GR2712 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2712 gene: GAM431 target protein and GAM432 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM431 and GAM432

[37497] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2713 (GR2713) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37498] GR2713 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2713 gene was detected is described hereinabove with reference to Figs. 6-15.

[37499] GR2713 gene encodes GR2713 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37500] GR2713 precursor RNA folds spatially, forming GR2713 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2713 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2713 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [37501] GR2713 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM433 precursor RNA and GAM434 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37502] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM433 RNA and GAM434 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37503] GAM433 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM433 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM433 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM433 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37504] GAM434 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM434 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM434 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM434 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37505] It is appreciated that specific functions, and accordingly utilities, of GR2713 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2713 gene: GAM433 target protein and GAM434 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM433 and GAM434

[37506] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2714 (GR2714) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37507] GR2714 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2714 gene was detected is described hereinabove with reference to Figs. 6-15.

[37508] GR2714 gene encodes GR2714 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37509] GR2714 precursor RNA folds spatially, forming GR2714 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2714 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2714 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37510] GR2714 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM440 precursor RNA and GAM441 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37511] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM440 RNA and GAM441 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37512] GAM440 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM440 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM440 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM440 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37513] GAM441 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM441 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM441 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM441 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37514] It is appreciated that specific functions, and accordingly utilities, of GR2714 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2714 gene: GAM440 target protein and GAM441 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM440 and GAM441

[37515] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2715(GR2715) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37516] GR2715 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2715 gene was detected is described hereinabove with reference to Figs. 6-15.

[37517] GR2715 gene encodes GR2715 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37518] GR2715 precursor RNA folds spatially, forming GR2715 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2715 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2715 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37519] GR2715 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM444 precursor RNA and

GAM445 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37520] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM444 RNA and GAM445 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37521] GAM444 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM444 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM444 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM444 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37522] GAM445 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM445 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM445 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM445 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37523] It is appreciated that specific functions, and accordingly utilities, of GR2715 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2715 gene: GAM444 target protein and GAM445 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM444 and GAM445

[37524] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2716 (GR2716) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37525] GR2716 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2716 gene was detected is described hereinabove with reference to Figs. 6-15.

[37526] GR2716 gene encodes GR2716 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37527] GR2716 precursor RNA folds spatially, forming GR2716 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2716 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2716 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37528] GR2716 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM454 precursor RNA and GAM455 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37529] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM454 RNA and GAM455 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37530] GAM454 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM454 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM454 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM454 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37531] GAM455 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM455 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM455 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM455 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37532] It is appreciated that specific functions, and accordingly utilities, of GR2716 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2716 gene: GAM454 target protein and GAM455 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM454 and GAM455

[37533] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2717 (GR2717) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[37534] GR2717 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2717 gene was detected is described hereinabove with reference to Figs. 6-15.

[37535] GR2717 gene encodes GR2717 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37536] GR2717 precursor RNA folds spatially, forming GR2717 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2717 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2717 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37537] GR2717 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM461 precursor RNA and GAM462 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

GAM PRECURSOR RNA of Fig. 8.

[37538] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM461 RNA and GAM462 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37539] GAM461 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM461 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM461 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM461 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37540] GAM462 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM462 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM462 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM462 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37541] It is appreciated that specific functions, and accordingly utilities, of GR2717 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2717 gene: GAM461 target protein and GAM462 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM461 and GAM462

[37542] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2718 (GR2718) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37543] GR2718 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2718 gene was detected is described hereinabove with reference to Figs. 6-15.

[37544] GR2718 gene encodes GR2718 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37545] GR2718 precursor RNA folds spatially, forming GR2718 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2718 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2718 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [37546] GR2718 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM467 precursor RNA and GAM468 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37547] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM467 RNA and GAM468 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37548] GAM467 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM467 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM467 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM467 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37549] GAM468 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM468 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM468 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM468 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37550] It is appreciated that specific functions, and accordingly utilities, of GR2718 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2718 gene: GAM467 target protein and GAM468 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM467 and GAM468

[37551] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2719 (GR2719) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37552] GR2719 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2719 gene was detected is described hereinabove with reference to Figs. 6-15.

[37553] GR2719 gene encodes GR2719 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37554] GR2719 precursor RNA folds spatially, forming GR2719 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2719 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2719 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37555] GR2719 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM471 precursor RNA and GAM472 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37556] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM471 RNA and GAM472 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37557] GAM471 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM471 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM471 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM471 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37558] GAM472 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM472 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM472 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM472 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37559] It is appreciated that specific functions, and accordingly utilities, of GR2719 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2719 gene: GAM471 target protein and GAM472 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM471 and GAM472

- [37560] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2720(GR2720) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37561] GR2720 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2720 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37562] GR2720 gene encodes GR2720 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37563] GR2720 precursor RNA folds spatially, forming GR2720 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2720 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2720 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37564] GR2720 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM473 precursor RNA and GAM474 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37565] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM473 RNA and GAM474 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37566] GAM473 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM473 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM473 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM473 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37567] GAM474 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM474 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM474 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM474 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37568] It is appreciated that specific functions, and accordingly utilities, of GR2720 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2720 gene: GAM473 target protein and GAM474 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM473 and GAM474

[37569] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2721 (GR2721) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37570] GR2721 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2721 gene was detected is described hereinabove with reference to Figs. 6-15.

[37571] GR2721 gene encodes GR2721 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[37572] GR2721 precursor RNA folds spatially, forming GR2721 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2721 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2721 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37573] GR2721 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM477 precursor RNA and GAM478 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37574] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM477 RNA and GAM478 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37575] GAM477 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM477 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM477 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM477 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37576] GAM478 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM478 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM478 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM478 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37577] It is appreciated that specific functions, and accordingly utilities, of GR2721 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2721 gene: GAM477 target protein and GAM478 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM477 and GAM478

[37578] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2722(GR2722) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37579] GR2722 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2722 gene was detected is described hereinabove with reference to Figs. 6-15.

[37580] GR2722 gene encodes GR2722 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37581] GR2722 precursor RNA folds spatially, forming GR2722 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2722 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2722 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37582] GR2722 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM483 precursor RNA and GAM484 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37583] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM483 RNA and GAM484 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37584] GAM483 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM483 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM483 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM483 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37585] GAM484 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM484 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM484 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM484 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37586] It is appreciated that specific functions, and accordingly utilities, of GR2722 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2722 gene: GAM483 target protein and GAM484 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM483 and GAM484

[37587] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2723 (GR2723) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37588] GR2723 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2723 gene was detected is described hereinabove with reference to Figs. 6-15.

[37589] GR2723 gene encodes GR2723 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37590] GR2723 precursor RNA folds spatially, forming GR2723 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2723 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2723 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37591] GR2723 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM485 precursor RNA and GAM486 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37592] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM485 RNA and GAM486 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37593] GAM485 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM485 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM485 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM485 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37594] GAM486 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM486 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM486 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM486 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37595] It is appreciated that specific functions, and accordingly utilities, of GR2723 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2723 gene: GAM485 target protein and GAM486 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM485 and GAM486

[37596] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2724 (GR2724) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37597] GR2724 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2724 gene was detected is described hereinabove with reference to Figs. 6-15.

[37598] GR2724 gene encodes GR2724 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37599] GR2724 precursor RNA folds spatially, forming GR2724 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2724 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2724 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37600] GR2724 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM488 precursor RNA and GAM489 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37601] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM488 RNA and GAM489 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37602] GAM488 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM488 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM488 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM488 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37603] GAM489 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM489 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM489 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM489 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37604] It is appreciated that specific functions, and accordingly utilities, of GR2724 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2724 gene: GAM488 target

protein and GAM489 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM488 and GAM489

[37605] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2725 (GR2725) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37606] GR2725 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2725 gene was detected is described hereinabove with reference to Figs. 6-15.

[37607] GR2725 gene encodes GR2725 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37608] GR2725 precursor RNA folds spatially, forming GR2725 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2725 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2725 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37609] GR2725 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM495 precursor RNA and GAM496 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37610] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM495 RNA and GAM496 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37611] GAM495 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM495 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM495 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM495 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37612] GAM496 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM496 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM496 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM496 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37613] It is appreciated that specific functions, and accordingly utilities, of GR2725 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2725 gene: GAM495 target protein and GAM496 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM495 and GAM496

[37614] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2726 (GR2726) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37615] GR2726 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2726 gene was detected is described hereinabove with reference to Figs. 6-15.

[37616] GR2726 gene encodes GR2726 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37617] GR2726 precursor RNA folds spatially, forming GR2726 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2726 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2726 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37618] GR2726 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM505 precursor RNA and GAM506 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37619] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM505 RNA and GAM506 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37620] GAM505 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM505 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM505 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM505 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37621] GAM506 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM506 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM506 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM506 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37622] It is appreciated that specific functions, and accordingly utilities, of GR2726 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2726 gene: GAM505 target protein and GAM506 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM505 and GAM506

- [37623] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2727(GR2727) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37624] GR2727 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2727 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37625] GR2727 gene encodes GR2727 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37626] GR2727 precursor RNA folds spatially, forming GR2727 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2727 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2727 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [37627] GR2727 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM508 precursor RNA and GAM509 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37628] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM508 RNA and GAM509 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37629] GAM508 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM508 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM508 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM508 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37630] GAM509 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM509 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM509 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM509 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37631] It is appreciated that specific functions, and accordingly utilities, of GR2727 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2727 gene: GAM508 target protein and GAM509 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM508 and GAM509

[37632] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2728 (GR2728) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37633] GR2728 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2728 gene was detected is described hereinabove with reference to Figs. 6-15.

[37634] GR2728 gene encodes GR2728 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37635] GR2728 precursor RNA folds spatially, forming GR2728 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2728 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2728 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37636] GR2728 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM520 precursor RNA and GAM521 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37637] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM520 RNA and GAM521 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37638] GAM520 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM520 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM520 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM520 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37639] GAM521 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM521 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM521 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM521 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37640] It is appreciated that specific functions, and accordingly utilities, of GR2728 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2728 gene: GAM520 target protein and GAM521 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM520 and GAM521

[37641] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2729(GR2729) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37642] GR2729 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2729 gene was detected is described hereinabove with reference to Figs. 6-15.

[37643] GR2729 gene encodes GR2729 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37644] GR2729 precursor RNA folds spatially, forming GR2729 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2729 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2729 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37645] GR2729 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM527 precursor RNA and GAM528 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37646] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM527 RNA and GAM528 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37647] GAM527 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM527 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM527 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM527 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37648] GAM528 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM528 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM528 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM528 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37649] It is appreciated that specific functions, and accordingly utilities, of GR2729

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2729 gene: GAM527 target protein and GAM528 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM527 and GAM528

[37650] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2730 (GR2730) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37651] GR2730 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2730 gene was detected is described hereinabove with reference to Figs. 6-15.

[37652] GR2730 gene encodes GR2730 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37653] GR2730 precursor RNA folds spatially, forming GR2730 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2730 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2730 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37654] GR2730 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM530 precursor RNA and GAM531 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37655] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM530 RNA and GAM531 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37656] GAM530 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM530 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM530 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM530 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37657] GAM531 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM531 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM531 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM531 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37658] It is appreciated that specific functions, and accordingly utilities, of GR2730 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2730 gene: GAM530 target protein and GAM531 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM530 and GAM531

[37659] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2731 (GR2731) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37660] GR2731 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2731 gene was detected is described hereinabove with reference to Figs. 6-15.

[37661] GR2731 gene encodes GR2731 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37662] GR2731 precursor RNA folds spatially, forming GR2731 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2731 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2731 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37663] GR2731 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM532 precursor RNA and GAM533 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37664] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM532 RNA and GAM533 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37665] GAM532 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM532 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM532 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM532 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37666] GAM533 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM533 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM533 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM533 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37667] It is appreciated that specific functions, and accordingly utilities, of GR2731 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2731 gene: GAM532 target protein and GAM533 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM532 and GAM533

[37668] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2732 (GR2732) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37669] GR2732 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2732 gene was detected is described hereinabove with reference to Figs. 6-15.

[37670] GR2732 gene encodes GR2732 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37671] GR2732 precursor RNA folds spatially, forming GR2732 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2732 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2732 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [37672] GR2732 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM539 precursor RNA and GAM540 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37673] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM539 RNA and GAM540 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37674] GAM539 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM539 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM539 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM539 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37675] GAM540 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM540 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM540 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM540 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37676] It is appreciated that specific functions, and accordingly utilities, of GR2732 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2732 gene: GAM539 target protein and GAM540 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM539 and GAM540

[37677] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2733 (GR2733) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37678] GR2733 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2733 gene was detected is described hereinabove with reference to Figs. 6-15.

[37679] GR2733 gene encodes GR2733 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37680] GR2733 precursor RNA folds spatially, forming GR2733 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2733 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2733 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37681] GR2733 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM541 precursor RNA and GAM542 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37682] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM541 RNA and GAM542 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37683] GAM541 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM541 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM541 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM541 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37684] GAM542 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM542 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM542 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM542 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37685] It is appreciated that specific functions, and accordingly utilities, of GR2733 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2733 gene: GAM541 target protein and GAM542 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM541 and GAM542

[37686] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2734(GR2734) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37687] GR2734 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2734 gene was detected is described hereinabove with reference to Figs. 6-15.

[37688] GR2734 gene encodes GR2734 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37689] GR2734 precursor RNA folds spatially, forming GR2734 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2734 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2734 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37690] GR2734 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM548 precursor RNA and

GAM549 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37691] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM548 RNA and GAM549 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37692] GAM548 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM548 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM548 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM548 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37693] GAM549 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM549 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM549 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM549 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37694] It is appreciated that specific functions, and accordingly utilities, of GR2734 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2734 gene: GAM548 target protein and GAM549 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM548 and GAM549

[37695] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2735 (GR2735) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37696] GR2735 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2735 gene was detected is described hereinabove with reference to Figs. 6-15.

[37697] GR2735 gene encodes GR2735 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37698] GR2735 precursor RNA folds spatially, forming GR2735 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2735 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2735 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37699] GR2735 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM552 precursor RNA, GAM553 precursor RNA and GAM554 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37700] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM552 RNA, GAM553 RNA and GAM554 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37701] GAM552 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM552 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM552 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM552 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37702] GAM553 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM553 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM553 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM553 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37703] GAM554 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM554 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM554 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM554 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[37704] It is appreciated that specific functions, and accordingly utilities, of GR2735 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2735 gene: GAM552 target protein, GAM553 target protein and GAM554 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM552, GAM553 and GAM554

[37705] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2736(GR2736) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37706] GR2736 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2736 gene was detected is described hereinabove with reference to Figs. 6-15.

[37707] GR2736 gene encodes GR2736 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37708] GR2736 precursor RNA folds spatially, forming GR2736 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2736 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2736 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37709] GR2736 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM557 precursor RNA and GAM558 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37710] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM557 RNA and GAM558 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37711] GAM557 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM557 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM557 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM557 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37712] GAM558 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM558 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM558 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM558 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37713] It is appreciated that specific functions, and accordingly utilities, of GR2736 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2736 gene: GAM557 target protein and GAM558 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM557 and GAM558

[37714] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2737 (GR2737) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37715] GR2737 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2737 gene was detected is described hereinabove with reference to Figs. 6-15.

[37716] GR2737 gene encodes GR2737 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37717] GR2737 precursor RNA folds spatially, forming GR2737 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2737 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2737 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37718] GR2737 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM561 precursor RNA and GAM562 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37719] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM561 RNA and GAM562 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37720] GAM561 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM561 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM561 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM561 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37721] GAM562 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM562 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM562 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM562 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37722] It is appreciated that specific functions, and accordingly utilities, of GR2737 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2737 gene: GAM561 target protein and GAM562 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM561 and GAM562

- [37723] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2738 (GR2738) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37724] GR2738 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2738 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37725] GR2738 gene encodes GR2738 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37726] GR2738 precursor RNA folds spatially, forming GR2738 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2738 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2738 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37727] GR2738 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM564 precursor RNA, GAM565 precursor RNA, GAM566 precursor RNA and GAM567 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37728] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM564 RNA, GAM565 RNA, GAM566 RNA and GAM567 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37729] GAM564 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM564 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM564 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM564 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37730] GAM565 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM565 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM565 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM565 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37731] GAM566 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM566 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM566 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM566 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[37732] GAM567 RNA, herein schematically represented by GAM4 binds complementarily to a target binding site located in an untranslated region of GAM567 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM567 target RNA, herein schematically represented by GAM4 TARGET RNA into GAM567 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[37733] It is appreciated that specific functions, and accordingly utilities, of GR2738 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2738 gene: GAM564 target protein, GAM565 target protein, GAM566 target protein and GAM567 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM564, GAM565, GAM566 and GAM567

[37734] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2739(GR2739) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37735] GR2739 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2739 gene was detected is described hereinabove with reference to Figs. 6-15.

[37736] GR2739 gene encodes GR2739 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37737] GR2739 precursor RNA folds spatially, forming GR2739 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2739 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2739 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37738] GR2739 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM571 precursor RNA and GAM572 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37739] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM571 RNA and GAM572 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37740] GAM571 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM571 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM571 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM571 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37741] GAM572 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM572 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM572 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM572 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37742] It is appreciated that specific functions, and accordingly utilities, of GR2739 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2739 gene: GAM571 target protein and GAM572 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM571 and GAM572

[37743] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2740 (GR2740) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37744] GR2740 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2740 gene was detected is described hereinabove with reference to Figs. 6-15.

[37745] GR2740 gene encodes GR2740 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37746] GR2740 precursor RNA folds spatially, forming GR2740 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2740 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2740 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [37747] GR2740 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM573 precursor RNA and GAM574 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37748] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM573 RNA and GAM574 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37749] GAM573 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM573 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM573 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM573 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37750] GAM574 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM574 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM574 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM574 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37751] It is appreciated that specific functions, and accordingly utilities, of GR2740 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2740 gene: GAM573 target protein and GAM574 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM573 and GAM574

[37752] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2741 (GR2741) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37753] GR2741 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2741 gene was detected is described hereinabove with reference to Figs. 6-15.

[37754] GR2741 gene encodes GR2741 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37755] GR2741 precursor RNA folds spatially, forming GR2741 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2741 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2741 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37756] GR2741 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM579 precursor RNA and GAM580 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37757] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM579 RNA and GAM580 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37758] GAM579 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM579 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM579 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM579 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37759] GAM580 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM580 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM580 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM580 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37760] It is appreciated that specific functions, and accordingly utilities, of GR2741 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2741 gene: GAM579 target protein and GAM580 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM579 and GAM580

[37761] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2742(GR2742) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37762] GR2742 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2742 gene was detected is described hereinabove with reference to Figs. 6-15.

[37763] GR2742 gene encodes GR2742 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37764] GR2742 precursor RNA folds spatially, forming GR2742 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2742 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2742 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37765] GR2742 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM582 precursor RNA and

GAM583 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37766] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM582 RNA and GAM583 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37767] GAM582 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM582 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM582 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM582 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37768] GAM583 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM583 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM583 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM583 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37769] It is appreciated that specific functions, and accordingly utilities, of GR2742 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2742 gene: GAM582 target protein and GAM583 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM582 and GAM583

[37770] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2743 (GR2743) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37771] GR2743 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2743 gene was detected is described hereinabove with reference to Figs. 6-15.

[37772] GR2743 gene encodes GR2743 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37773] GR2743 precursor RNA folds spatially, forming GR2743 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2743 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2743 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37774] GR2743 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM592 precursor RNA and GAM593 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37775] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM592 RNA and GAM593 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37776] GAM592 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM592 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM592 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM592 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37777] GAM593 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM593 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM593 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM593 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37778] It is appreciated that specific functions, and accordingly utilities, of GR2743 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2743 gene: GAM592 target protein and GAM593 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM592 and GAM593

[37779] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2744(GR2744) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[37780] GR2744 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2744 gene was detected is described hereinabove with reference to Figs. 6-15.

[37781] GR2744 gene encodes GR2744 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37782] GR2744 precursor RNA folds spatially, forming GR2744 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2744 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2744 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37783] GR2744 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM594 precursor RNA and GAM595 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

GAM PRECURSOR RNA of Fig. 8.

[37784] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM594 RNA and GAM595 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37785] GAM594 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM594 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM594 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM594 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37786] GAM595 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM595 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM595 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM595 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37787] It is appreciated that specific functions, and accordingly utilities, of GR2744 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2744 gene: GAM594 target protein and GAM595 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM594 and GAM595

[37788] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2745 (GR2745) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37789] GR2745 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2745 gene was detected is described hereinabove with reference to Figs. 6-15.

[37790] GR2745 gene encodes GR2745 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37791] GR2745 precursor RNA folds spatially, forming GR2745 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2745 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2745 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37792] GR2745 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM604 precursor RNA and GAM605 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37793] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM604 RNA and GAM605 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37794] GAM604 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM604 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM604 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM604 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37795] GAM605 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM605 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM605 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM605 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37796] It is appreciated that specific functions, and accordingly utilities, of GR2745 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2745 gene: GAM604 target protein and GAM605 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM604 and GAM605

[37797] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2746 (GR2746) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37798] GR2746 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2746 gene was detected is described hereinabove with reference to Figs. 6-15.

[37799] GR2746 gene encodes GR2746 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37800] GR2746 precursor RNA folds spatially, forming GR2746 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2746 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2746 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37801] GR2746 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM608 precursor RNA and GAM609 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37802] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM608 RNA and GAM609 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37803] GAM608 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM608 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM608 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM608 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37804] GAM609 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM609 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM609 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM609 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37805] It is appreciated that specific functions, and accordingly utilities, of GR2746 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2746 gene: GAM608 target protein and GAM609 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM608 and GAM609

- [37806] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2747(GR2747) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37807] GR2747 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2747 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37808] GR2747 gene encodes GR2747 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37809] GR2747 precursor RNA folds spatially, forming GR2747 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2747 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2747 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [37810] GR2747 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM610 precursor RNA and GAM611 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37811] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM610 RNA and GAM611 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37812] GAM610 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM610 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM610 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM610 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37813] GAM611 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM611 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM611 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM611 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37814] It is appreciated that specific functions, and accordingly utilities, of GR2747 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2747 gene: GAM610 target protein and GAM611 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM610 and GAM611

[37815] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2748 (GR2748) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37816] GR2748 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2748 gene was detected is described hereinabove with reference to Figs. 6-15.

[37817] GR2748 gene encodes GR2748 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[37818] GR2748 precursor RNA folds spatially, forming GR2748 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2748 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2748 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37819] GR2748 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM612 precursor RNA and GAM613 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37820] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM612 RNA and GAM613 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37821] GAM612 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM612 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM612 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM612 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37822] GAM613 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM613 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM613 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM613 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37823] It is appreciated that specific functions, and accordingly utilities, of GR2748 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2748 gene: GAM612 target protein and GAM613 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM612 and GAM613

[37824] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2749(GR2749) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37825] GR2749 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2749 gene was detected is described hereinabove with reference to Figs. 6-15.

[37826] GR2749 gene encodes GR2749 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37827] GR2749 precursor RNA folds spatially, forming GR2749 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2749 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2749 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37828] GR2749 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM623 precursor RNA, GAM624 precursor RNA and GAM625 precursor RNA, herein schematically

represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37829] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM623 RNA, GAM624 RNA and GAM625 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37830] GAM623 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM623 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM623 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM623 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37831] GAM624 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM624 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM624 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM624 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37832] GAM625 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM625 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM625 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM625 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[37833] It is appreciated that specific functions, and accordingly utilities, of GR2749 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2749 gene: GAM623 target protein, GAM624 target protein and GAM625 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM623, GAM624 and GAM625

[37834] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2750(GR2750) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

- [37835] GR2750 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2750 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37836] GR2750 gene encodes GR2750 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37837] GR2750 precursor RNA folds spatially, forming GR2750 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2750 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2750 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [37838] GR2750 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM627 precursor RNA and GAM628 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37839] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM627 RNA and GAM628 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37840] GAM627 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM627 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM627 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM627 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37841] GAM628 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM628 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM628 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM628 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37842] It is appreciated that specific functions, and accordingly utilities, of GR2750 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2750 gene: GAM627 target

protein and GAM628 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM627 and GAM628

[37843] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2751 (GR2751) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37844] GR2751 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2751 gene was detected is described hereinabove with reference to Figs. 6-15.

[37845] GR2751 gene encodes GR2751 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37846] GR2751 precursor RNA folds spatially, forming GR2751 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2751 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2751 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37847] GR2751 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM635 precursor RNA and GAM636 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37848] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM635 RNA and GAM636 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37849] GAM635 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM635 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM635 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM635 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37850] GAM636 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM636 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM636 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM636 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37851] It is appreciated that specific functions, and accordingly utilities, of GR2751 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2751 gene: GAM635 target protein and GAM636 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM635 and GAM636

[37852] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2752 (GR2752) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37853] GR2752 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2752 gene was detected is described hereinabove with reference to Figs. 6-15.

[37854] GR2752 gene encodes GR2752 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37855] GR2752 precursor RNA folds spatially, forming GR2752 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2752 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2752 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37856] GR2752 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM655 precursor RNA and GAM656 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37857] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM655 RNA and GAM656 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37858] GAM655 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM655 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM655 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM655 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37859] GAM656 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM656 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM656 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM656 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37860] It is appreciated that specific functions, and accordingly utilities, of GR2752 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2752 gene: GAM655 target protein and GAM656 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM655 and GAM656

- [37861] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2753(GR2753) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37862] GR2753 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2753 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37863] GR2753 gene encodes GR2753 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37864] GR2753 precursor RNA folds spatially, forming GR2753 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2753 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2753 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [37865] GR2753 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM657 precursor RNA and GAM658 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37866] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM657 RNA and GAM658 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37867] GAM657 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM657 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM657 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM657 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37868] GAM658 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM658 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM658 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM658 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37869] It is appreciated that specific functions, and accordingly utilities, of GR2753 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2753 gene: GAM657 target protein and GAM658 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM657 and GAM658

[37870] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2754 (GR2754) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37871] GR2754 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2754 gene was detected is described hereinabove with reference to Figs. 6-15.

[37872] GR2754 gene encodes GR2754 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37873] GR2754 precursor RNA folds spatially, forming GR2754 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2754 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2754 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37874] GR2754 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM659 precursor RNA, GAM660 precursor RNA and GAM661 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37875] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM659 RNA, GAM660 RNA and GAM661 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37876] GAM659 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM659 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM659 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM659 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37877] GAM660 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM660 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM660 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM660 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37878] GAM661 RNA, herein schematically represented by GAM3 binds complimentarily to a target binding site located in an untranslated region of GAM661 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM661 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM661 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[37879] It is appreciated that specific functions, and accordingly utilities, of GR2754

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2754 gene: GAM659 target protein, GAM660 target protein and GAM661 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM659, GAM660 and GAM661

[37880] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2755(GR2755) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37881] GR2755 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2755 gene was detected is described hereinabove with reference to Figs. 6-15.

[37882] GR2755 gene encodes GR2755 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37883] GR2755 precursor RNA folds spatially, forming GR2755 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2755 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2755 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37884] GR2755 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM662 precursor RNA and GAM663 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37885] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM662 RNA and GAM663 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37886] GAM662 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM662 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM662 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM662 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37887] GAM663 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM663 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM663 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM663 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37888] It is appreciated that specific functions, and accordingly utilities, of GR2755 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2755 gene: GAM662 target protein and GAM663 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM662 and GAM663

[37889] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2756 (GR2756) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37890] GR2756 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2756 gene was detected is described hereinabove with reference to Figs. 6-15.

[37891] GR2756 gene encodes GR2756 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37892] GR2756 precursor RNA folds spatially, forming GR2756 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2756 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2756 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37893] GR2756 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM665 precursor RNA and GAM666 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37894] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM665 RNA and GAM666 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37895] GAM665 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM665 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM665 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM665 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37896] GAM666 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM666 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM666 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM666 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37897] It is appreciated that specific functions, and accordingly utilities, of GR2756 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2756 gene: GAM665 target protein and GAM666 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM665 and GAM666

[37898] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2757 (GR2757) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37899] GR2757 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2757 gene was detected is described hereinabove with reference to Figs. 6-15.

[37900] GR2757 gene encodes GR2757 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37901] GR2757 precursor RNA folds spatially, forming GR2757 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2757 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2757 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [37902] GR2757 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM667 precursor RNA and GAM668 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37903] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM667 RNA and GAM668 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37904] GAM667 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM667 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM667 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM667 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37905] GAM668 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM668 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM668 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM668 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37906] It is appreciated that specific functions, and accordingly utilities, of GR2757 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2757 gene: GAM667 target protein and GAM668 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM667 and GAM668

[37907] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2758 (GR2758) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37908] GR2758 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2758 gene was detected is described hereinabove with reference to Figs. 6-15.

[37909] GR2758 gene encodes GR2758 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37910] GR2758 precursor RNA folds spatially, forming GR2758 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2758 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2758 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37911] GR2758 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM669 precursor RNA and GAM670 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37912] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM669 RNA and GAM670 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37913] GAM669 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM669 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM669 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM669 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37914] GAM670 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM670 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM670 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM670 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37915] It is appreciated that specific functions, and accordingly utilities, of GR2758 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2758 gene: GAM669 target protein and GAM670 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM669 and GAM670

[37916] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2759(GR2759) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37917] GR2759 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2759 gene was detected is described hereinabove with reference to Figs. 6-15.

[37918] GR2759 gene encodes GR2759 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37919] GR2759 precursor RNA folds spatially, forming GR2759 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2759 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2759 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37920] GR2759 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM673 precursor RNA and

GAM674 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37921] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM673 RNA and GAM674 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37922] GAM673 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM673 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM673 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM673 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37923] GAM674 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM674 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM674 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM674 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37924] It is appreciated that specific functions, and accordingly utilities, of GR2759 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2759 gene: GAM673 target protein and GAM674 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM673 and GAM674

[37925] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2760 (GR2760) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37926] GR2760 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2760 gene was detected is described hereinabove with reference to Figs. 6-15.

[37927] GR2760 gene encodes GR2760 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37928] GR2760 precursor RNA folds spatially, forming GR2760 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2760 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2760 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37929] GR2760 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM675 precursor RNA and GAM676 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37930] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM675 RNA and GAM676 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37931] GAM675 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM675 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM675 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM675 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37932] GAM676 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM676 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM676 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM676 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37933] It is appreciated that specific functions, and accordingly utilities, of GR2760 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2760 gene: GAM675 target protein and GAM676 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM675 and GAM676

[37934] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2761 (GR2761) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[37935] GR2761 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2761 gene was detected is described hereinabove with reference to Figs. 6-15.

[37936] GR2761 gene encodes GR2761 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37937] GR2761 precursor RNA folds spatially, forming GR2761 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2761 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2761 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37938] GR2761 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM679 precursor RNA, GAM680 precursor RNA and GAM681 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a

hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37939] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM679 RNA, GAM680 RNA and GAM681 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37940] GAM679 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM679 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM679 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM679 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37941] GAM680 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM680 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM680 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM680 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37942] GAM681 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM681 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM681 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM681 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[37943] It is appreciated that specific functions, and accordingly utilities, of GR2761 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2761 gene: GAM679 target protein, GAM680 target protein and GAM681 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM679, GAM680 and GAM681

[37944] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2762(GR2762) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37945] GR2762 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2762 gene was detected is described hereinabove with reference to Figs. 6-15.

[37946] GR2762 gene encodes GR2762 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37947] GR2762 precursor RNA folds spatially, forming GR2762 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2762 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2762 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37948] GR2762 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM689 precursor RNA and GAM690 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37949] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM689 RNA and GAM690 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37950] GAM689 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM689 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM689 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM689 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37951] GAM690 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM690 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM690 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM690 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37952] It is appreciated that specific functions, and accordingly utilities, of GR2762 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2762 gene: GAM689 target protein and GAM690 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM689 and GAM690

- [37953] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2763 (GR2763) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37954] GR2763 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2763 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37955] GR2763 gene encodes GR2763 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37956] GR2763 precursor RNA folds spatially, forming GR2763 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2763 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2763 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [37957] GR2763 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM691 precursor RNA and GAM692 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37958] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM691 RNA and GAM692 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37959] GAM691 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM691 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM691 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM691 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37960] GAM692 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM692 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM692 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM692 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37961] It is appreciated that specific functions, and accordingly utilities, of GR2763 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2763 gene: GAM691 target protein and GAM692 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM691 and GAM692

[37962] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2764 (GR2764) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37963] GR2764 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2764 gene was detected is described hereinabove with reference to Figs. 6-15.

[37964] GR2764 gene encodes GR2764 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[37965] GR2764 precursor RNA folds spatially, forming GR2764 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2764 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2764 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37966] GR2764 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM694 precursor RNA, GAM695 precursor RNA, GAM696 precursor RNA and GAM697 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37967] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM694 RNA, GAM695 RNA, GAM696 RNA and GAM697 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37968] GAM694 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM694 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM694 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM694 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37969] GAM695 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM695 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM695 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM695 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37970] GAM696 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM696 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM696 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM696 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[37971] GAM697 RNA, herein schematically represented by GAM4 binds complementarily to a target binding site located in an untranslated region of GAM697 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM697 target RNA, herein schematically represented by GAM4 TARGET RNA into GAM697 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[37972] It is appreciated that specific functions, and accordingly utilities, of GR2764 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2764 gene: GAM694 target protein, GAM695 target protein, GAM696 target protein and GAM697 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM694, GAM695, GAM696 and GAM697

[37973] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2765(GR2765) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37974] GR2765 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2765 gene was detected is described hereinabove with reference to Figs. 6-15.

[37975] GR2765 gene encodes GR2765 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37976] GR2765 precursor RNA folds spatially, forming GR2765 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2765 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2765 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37977] GR2765 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM702 precursor RNA and GAM703 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37978] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM702 RNA and GAM703 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37979] GAM702 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM702 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM702 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM702 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37980] GAM703 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM703 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM703 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM703 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37981] It is appreciated that specific functions, and accordingly utilities, of GR2765 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2765 gene: GAM702 target protein and GAM703 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM702 and GAM703

- [37982] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2766 (GR2766) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [37983] GR2766 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2766 gene was detected is described hereinabove with reference to Figs. 6-15.
- [37984] GR2766 gene encodes GR2766 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [37985] GR2766 precursor RNA folds spatially, forming GR2766 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2766 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2766 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [37986] GR2766 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM709 precursor RNA and GAM710 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [37987] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM709 RNA and GAM710 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [37988] GAM709 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM709 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM709 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM709 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [37989] GAM710 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM710 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM710 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM710 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37990] It is appreciated that specific functions, and accordingly utilities, of GR2766 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2766 gene: GAM709 target protein and GAM710 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM709 and GAM710

[37991] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2767 (GR2767) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[37992] GR2767 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2767 gene was detected is described hereinabove with reference to Figs. 6-15.

[37993] GR2767 gene encodes GR2767 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[37994] GR2767 precursor RNA folds spatially, forming GR2767 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2767 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2767 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[37995] GR2767 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM722 precursor RNA and GAM723 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[37996] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM722 RNA and GAM723 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[37997] GAM722 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM722 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM722 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM722 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[37998] GAM723 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM723 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM723 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM723 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[37999] It is appreciated that specific functions, and accordingly utilities, of GR2767 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2767 gene: GAM722 target protein and GAM723 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM722 and GAM723

[38000] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2768(GR2768) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38001] GR2768 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2768 gene was detected is described hereinabove with reference to Figs. 6-15.

[38002] GR2768 gene encodes GR2768 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38003] GR2768 precursor RNA folds spatially, forming GR2768 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2768 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2768 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38004] GR2768 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM724 precursor RNA and

GAM725 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38005] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM724 RNA and GAM725 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38006] GAM724 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM724 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM724 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM724 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38007] GAM725 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM725 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM725 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM725 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38008] It is appreciated that specific functions, and accordingly utilities, of GR2768 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2768 gene: GAM724 target protein and GAM725 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM724 and GAM725

[38009] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2769 (GR2769) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38010] GR2769 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2769 gene was detected is described hereinabove with reference to Figs. 6-15.

[38011] GR2769 gene encodes GR2769 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38012] GR2769 precursor RNA folds spatially, forming GR2769 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2769 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2769 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38013] GR2769 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM730 precursor RNA and GAM731 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38014] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM730 RNA and GAM731 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38015] GAM730 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM730 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM730 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM730 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38016] GAM731 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM731 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM731 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM731 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38017] It is appreciated that specific functions, and accordingly utilities, of GR2769 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2769 gene: GAM730 target protein and GAM731 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM730 and GAM731

[38018] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2770 (GR2770) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[38019] GR2770 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2770 gene was detected is described hereinabove with reference to Figs. 6-15.

[38020] GR2770 gene encodes GR2770 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38021] GR2770 precursor RNA folds spatially, forming GR2770 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2770 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2770 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38022] GR2770 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM734 precursor RNA and GAM735 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

GAM PRECURSOR RNA of Fig. 8.

[38023] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM734 RNA and GAM735 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38024] GAM734 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM734 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM734 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM734 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38025] GAM735 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM735 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM735 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM735 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38026] It is appreciated that specific functions, and accordingly utilities, of GR2770 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2770 gene: GAM734 target protein and GAM735 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM734 and GAM735

[38027] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2771 (GR2771) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38028] GR2771 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2771 gene was detected is described hereinabove with reference to Figs. 6-15.

[38029] GR2771 gene encodes GR2771 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38030] GR2771 precursor RNA folds spatially, forming GR2771 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2771 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2771 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [38031] GR2771 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM739 precursor RNA and GAM740 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38032] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM739 RNA and GAM740 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38033] GAM739 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM739 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM739 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM739 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38034] GAM740 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM740 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM740 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM740 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38035] It is appreciated that specific functions, and accordingly utilities, of GR2771 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2771 gene: GAM739 target protein and GAM740 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM739 and GAM740

[38036] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2772 (GR2772) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38037] GR2772 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2772 gene was detected is described hereinabove with reference to Figs. 6-15.

[38038] GR2772 gene encodes GR2772 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38039] GR2772 precursor RNA folds spatially, forming GR2772 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2772 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2772 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38040] GR2772 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM745 precursor RNA and GAM746 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38041] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM745 RNA and GAM746 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38042] GAM745 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM745 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM745 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM745 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38043] GAM746 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM746 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM746 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM746 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38044] It is appreciated that specific functions, and accordingly utilities, of GR2772 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2772 gene: GAM745 target protein and GAM746 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM745 and GAM746

- [38045] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2773(GR2773) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38046] GR2773 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2773 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38047] GR2773 gene encodes GR2773 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38048] GR2773 precursor RNA folds spatially, forming GR2773 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2773 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2773 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38049] GR2773 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM750 precursor RNA and GAM751 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38050] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM750 RNA and GAM751 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38051] GAM750 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM750 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM750 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM750 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38052] GAM751 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM751 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM751 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM751 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38053] It is appreciated that specific functions, and accordingly utilities, of GR2773 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2773 gene: GAM750 target protein and GAM751 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM750 and GAM751

[38054] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2774 (GR2774) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38055] GR2774 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2774 gene was detected is described hereinabove with reference to Figs. 6-15.

[38056] GR2774 gene encodes GR2774 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[38057] GR2774 precursor RNA folds spatially, forming GR2774 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2774 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2774 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38058] GR2774 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM755 precursor RNA, GAM756 precursor RNA and GAM757 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38059] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM755 RNA, GAM756 RNA and GAM757 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38060] GAM755 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM755 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM755 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM755 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38061] GAM756 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM756 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM756 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM756 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38062] GAM757 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM757 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM757 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM757 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38063] It is appreciated that specific functions, and accordingly utilities, of GR2774 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2774 gene: GAM755 target protein, GAM756 target protein and GAM757 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM755, GAM756 and GAM757

[38064] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2775(GR2775) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38065] GR2775 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2775 gene was detected is described hereinabove with reference to Figs. 6-15.

[38066] GR2775 gene encodes GR2775 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38067] GR2775 precursor RNA folds spatially, forming GR2775 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2775 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2775 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38068] GR2775 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM763 precursor RNA, GAM764 precursor RNA and GAM765 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38069] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM763 RNA, GAM764 RNA and GAM765 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38070] GAM763 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM763 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM763 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM763 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38071] GAM764 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM764 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM764 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM764 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38072] GAM765 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM765 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM765 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM765 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38073] It is appreciated that specific functions, and accordingly utilities, of GR2775 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2775 gene: GAM763 target

protein, GAM764 target protein and GAM765 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM763, GAM764 and GAM765

[38074] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2776(GR2776) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38075] GR2776 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2776 gene was detected is described hereinabove with reference to Figs. 6-15.

[38076] GR2776 gene encodes GR2776 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38077] GR2776 precursor RNA folds spatially, forming GR2776 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2776 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2776 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38078] GR2776 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM766 precursor RNA, GAM767 precursor RNA, GAM768 precursor RNA and GAM769 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38079] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM766 RNA, GAM767 RNA, GAM768 RNA and GAM769 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38080] GAM766 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM766 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM766 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM766 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38081] GAM767 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM767 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM767 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM767 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38082] GAM768 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM768 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM768 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM768 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38083] GAM769 RNA, herein schematically represented by GAM4 binds complementarily to a target binding site located in an untranslated region of GAM769 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM769 target RNA, herein schematically represented by GAM4 TARGET RNA into GAM769 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[38084] It is appreciated that specific functions, and accordingly utilities, of GR2776 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2776 gene: GAM766 target protein, GAM767 target protein, GAM768 target protein and GAM769 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM766, GAM767, GAM768 and GAM769

[38085] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2777(GR2777) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38086] GR2777 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2777 gene was detected is described hereinabove with reference to Figs. 6-15.

[38087] GR2777 gene encodes GR2777 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38088] GR2777 precursor RNA folds spatially, forming GR2777 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated

that GR2777 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2777 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38089] GR2777 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM775 precursor RNA, GAM776 precursor RNA and GAM777 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38090] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM775 RNA, GAM776 RNA and GAM777 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38091] GAM775 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM775 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM775 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM775 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38092] GAM776 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM776 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM776 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM776 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38093] GAM777 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM777 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM777 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM777 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38094] It is appreciated that specific functions, and accordingly utilities, of GR2777 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs

comprised in the operon-like cluster of GR2777 gene: GAM775 target protein, GAM776 target protein and GAM777 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM775, GAM776 and GAM777

[38095] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2778(GR2778) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38096] GR2778 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2778 gene was detected is described hereinabove with reference to Figs. 6-15.

[38097] GR2778 gene encodes GR2778 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38098] GR2778 precursor RNA folds spatially, forming GR2778 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2778 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2778 precursor RNA comprises a plurality of

segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38099] GR2778 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM783 precursor RNA and GAM784 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38100] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM783 RNA and GAM784 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38101] GAM783 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM783 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM783 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM783 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38102] GAM784 RNA, herein schematically represented by GAM2 binds

complimentarily to a target binding site located in an untranslated region of GAM784 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM784 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM784 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38103] It is appreciated that specific functions, and accordingly utilities, of GR2778 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2778 gene: GAM783 target protein and GAM784 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM783 and GAM784

[38104] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2779 (GR2779) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38105] GR2779 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2779 gene was detected is described hereinabove with reference to Figs.

- [38106] GR2779 gene encodes GR2779 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38107] GR2779 precursor RNA folds spatially, forming GR2779 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2779 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2779 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38108] GR2779 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM788 precursor RNA and GAM789 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38109] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM788 RNA and GAM789 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which

GAM RNAs corresponding to GAM RNA of Fig. 8.

[38110] GAM788 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM788 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM788 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM788 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38111] GAM789 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM789 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM789 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM789 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38112] It is appreciated that specific functions, and accordingly utilities, of GR2779 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2779 gene: GAM788 target protein and GAM789 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to

- [38113] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2780 (GR2780) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38114] GR2780 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2780 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38115] GR2780 gene encodes GR2780 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38116] GR2780 precursor RNA folds spatially, forming GR2780 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2780 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2780 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [38117] GR2780 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM798 precursor RNA and GAM799 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38118] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM798 RNA and GAM799 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38119] GAM798 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM798 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM798 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM798 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [38120] GAM799 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM799 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM799 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM799 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38121] It is appreciated that specific functions, and accordingly utilities, of GR2780 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2780 gene: GAM798 target protein and GAM799 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM798 and GAM799

[38122] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2781 (GR2781) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38123] GR2781 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2781 gene was detected is described hereinabove with reference to Figs. 6-15.

[38124] GR2781 gene encodes GR2781 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[38125] GR2781 precursor RNA folds spatially, forming GR2781 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2781 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2781 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38126] GR2781 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM805 precursor RNA and GAM806 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38127] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM805 RNA and GAM806 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38128] GAM805 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM805 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM805 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM805 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38129] GAM806 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM806 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM806 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM806 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38130] It is appreciated that specific functions, and accordingly utilities, of GR2781 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2781 gene: GAM805 target protein and GAM806 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM805 and GAM806

[38131] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2782(GR2782) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38132] GR2782 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2782 gene was detected is described hereinabove with reference to Figs. 6-15.

[38133] GR2782 gene encodes GR2782 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38134] GR2782 precursor RNA folds spatially, forming GR2782 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2782 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2782 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38135] GR2782 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM816 precursor RNA, GAM817 precursor RNA, GAM818 precursor RNA and GAM819 precursor

RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38136] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM816 RNA, GAM817 RNA, GAM818 RNA and GAM819 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38137] GAM816 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM816 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM816 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM816 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38138] GAM817 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM817 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM817 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM817 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38139] GAM818 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM818 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM818 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM818 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38140] GAM819 RNA, herein schematically represented by GAM4 binds complementarily to a target binding site located in an untranslated region of GAM819 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM819 target RNA, herein schematically represented by GAM4 TARGET RNA into GAM819 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[38141] It is appreciated that specific functions, and accordingly utilities, of GR2782 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2782 gene: GAM816 target protein, GAM817 target protein, GAM818 target protein and GAM819 target protein, herein schematically represented by GAM1 TARGET PROTEIN

through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM816, GAM817, GAM818 and GAM819

- [38142] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2783(GR2783) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38143] GR2783 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2783 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38144] GR2783 gene encodes GR2783 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38145] GR2783 precursor RNA folds spatially, forming GR2783 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2783 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2783 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [38146] GR2783 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM824 precursor RNA and GAM825 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38147] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM824 RNA and GAM825 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38148] GAM824 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM824 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM824 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM824 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [38149] GAM825 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM825 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM825 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM825 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38150] It is appreciated that specific functions, and accordingly utilities, of GR2783 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2783 gene: GAM824 target protein and GAM825 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM824 and GAM825

[38151] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2784 (GR2784) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38152] GR2784 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2784 gene was detected is described hereinabove with reference to Figs. 6-15.

[38153] GR2784 gene encodes GR2784 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38154] GR2784 precursor RNA folds spatially, forming GR2784 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2784 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2784 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38155] GR2784 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM831 precursor RNA and GAM832 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38156] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM831 RNA and GAM832 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38157] GAM831 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM831 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM831 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM831 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38158] GAM832 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM832 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM832 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM832 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38159] It is appreciated that specific functions, and accordingly utilities, of GR2784 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2784 gene: GAM831 target protein and GAM832 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM831 and GAM832

[38160] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record 2785(GR2785) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38161] GR2785 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2785 gene was detected is described hereinabove with reference to Figs. 6-15.

[38162] GR2785 gene encodes GR2785 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38163] GR2785 precursor RNA folds spatially, forming GR2785 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2785 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2785 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38164] GR2785 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM835 precursor RNA and

GAM836 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38165] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM835 RNA and GAM836 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38166] GAM835 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM835 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM835 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM835 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38167] GAM836 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM836 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM836 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM836 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38168] It is appreciated that specific functions, and accordingly utilities, of GR2785 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2785 gene: GAM835 target protein and GAM836 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM835 and GAM836

[38169] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2786 (GR2786) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38170] GR2786 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2786 gene was detected is described hereinabove with reference to Figs. 6-15.

[38171] GR2786 gene encodes GR2786 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38172] GR2786 precursor RNA folds spatially, forming GR2786 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2786 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2786 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38173] GR2786 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM841 precursor RNA, GAM842 precursor RNA and GAM843 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38174] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM841 RNA, GAM842 RNA and GAM843 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38175] GAM841 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM841 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM841 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM841 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38176] GAM842 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM842 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM842 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM842 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38177] GAM843 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM843 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM843 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM843 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38178] It is appreciated that specific functions, and accordingly utilities, of GR2786 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2786 gene: GAM841 target protein, GAM842 target protein and GAM843 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM841, GAM842 and GAM843

[38179] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2787(GR2787) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38180] GR2787 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2787 gene was detected is described hereinabove with reference to Figs. 6-15.

[38181] GR2787 gene encodes GR2787 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38182] GR2787 precursor RNA folds spatially, forming GR2787 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2787 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2787 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [38183] GR2787 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM845 precursor RNA and GAM846 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38184] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM845 RNA and GAM846 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38185] GAM845 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM845 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM845 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM845 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38186] GAM846 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM846 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM846 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM846 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38187] It is appreciated that specific functions, and accordingly utilities, of GR2787 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2787 gene: GAM845 target protein and GAM846 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM845 and GAM846

[38188] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2788 (GR2788) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38189] GR2788 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2788 gene was detected is described hereinabove with reference to Figs. 6-15.

[38190] GR2788 gene encodes GR2788 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38191] GR2788 precursor RNA folds spatially, forming GR2788 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2788 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2788 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38192] GR2788 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM858 precursor RNA and GAM859 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38193] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM858 RNA and GAM859 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38194] GAM858 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM858 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM858 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM858 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38195] GAM859 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM859 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM859 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM859 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38196] It is appreciated that specific functions, and accordingly utilities, of GR2788 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2788 gene: GAM858 target protein and GAM859 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM858 and GAM859

- [38197] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2789 (GR2789) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38198] GR2789 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2789 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38199] GR2789 gene encodes GR2789 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38200] GR2789 precursor RNA folds spatially, forming GR2789 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2789 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2789 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [38201] GR2789 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM860 precursor RNA, GAM861 precursor RNA and GAM862 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38202] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM860 RNA, GAM861 RNA and GAM862 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38203] GAM860 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM860 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM860 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM860 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [38204] GAM861 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM861 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM861 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM861 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38205] GAM862 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM862 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM862 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM862 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38206] It is appreciated that specific functions, and accordingly utilities, of GR2789 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2789 gene: GAM860 target protein, GAM861 target protein and GAM862 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM860, GAM861 and GAM862

[38207] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2790(GR2790) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38208] GR2790 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2790 gene was detected is described hereinabove with reference to Figs. 6-15.

[38209] GR2790 gene encodes GR2790 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38210] GR2790 precursor RNA folds spatially, forming GR2790 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2790 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2790 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38211] GR2790 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM864 precursor RNA and GAM865 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38212] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM864 RNA and GAM865 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38213] GAM864 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM864 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM864 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM864 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38214] GAM865 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM865 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM865 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM865 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38215] It is appreciated that specific functions, and accordingly utilities, of GR2790 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2790 gene: GAM864 target protein and GAM865 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM864 and GAM865

[38216] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2791 (GR2791) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38217] GR2791 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2791 gene was detected is described hereinabove with reference to Figs. 6-15.

[38218] GR2791 gene encodes GR2791 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38219] GR2791 precursor RNA folds spatially, forming GR2791 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2791 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2791 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38220] GR2791 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM872 precursor RNA and GAM873 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38221] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM872 RNA and GAM873 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38222] GAM872 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM872 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM872 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM872 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38223] GAM873 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM873 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM873 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM873 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38224] It is appreciated that specific functions, and accordingly utilities, of GR2791 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2791 gene: GAM872 target protein and GAM873 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM872 and GAM873

[38225] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2792 (GR2792) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38226] GR2792 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2792 gene was detected is described hereinabove with reference to Figs. 6-15.

[38227] GR2792 gene encodes GR2792 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38228] GR2792 precursor RNA folds spatially, forming GR2792 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2792 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2792 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38229] GR2792 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM876 precursor RNA, GAM877 precursor RNA and GAM878 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38230] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM876 RNA, GAM877 RNA and GAM878 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38231] GAM876 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM876 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM876 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM876 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38232] GAM877 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM877 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM877 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM877 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38233] GAM878 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of

GAM878 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM878 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM878 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38234] It is appreciated that specific functions, and accordingly utilities, of GR2792 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2792 gene: GAM876 target protein, GAM877 target protein and GAM878 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM876, GAM877 and GAM878

[38235] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2793(GR2793) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38236] GR2793 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2793 gene was detected is described hereinabove with reference to Figs. 6-15.

[38237] GR2793 gene encodes GR2793 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38238] GR2793 precursor RNA folds spatially, forming GR2793 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2793 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2793 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38239] GR2793 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM882 precursor RNA and GAM883 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38240] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM882 RNA and GAM883 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38241] GAM882 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM882 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM882 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM882 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38242] GAM883 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM883 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM883 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM883 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38243] It is appreciated that specific functions, and accordingly utilities, of GR2793 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2793 gene: GAM882 target protein and GAM883 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM882 and GAM883

- [38244] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2794(GR2794) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38245] GR2794 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2794 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38246] GR2794 gene encodes GR2794 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38247] GR2794 precursor RNA folds spatially, forming GR2794 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2794 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2794 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38248] GR2794 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM890 precursor RNA and GAM891 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38249] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM890 RNA and GAM891 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38250] GAM890 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM890 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM890 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM890 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38251] GAM891 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM891 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM891 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM891 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38252] It is appreciated that specific functions, and accordingly utilities, of GR2794 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2794 gene: GAM890 target protein and GAM891 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM890 and GAM891

[38253] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2795 (GR2795) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38254] GR2795 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2795 gene was detected is described hereinabove with reference to Figs. 6-15.

[38255] GR2795 gene encodes GR2795 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38256] GR2795 precursor RNA folds spatially, forming GR2795 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2795 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2795 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38257] GR2795 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM894 precursor RNA and GAM895 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38258] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM894 RNA and GAM895 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38259] GAM894 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM894 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM894 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM894 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38260] GAM895 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM895 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM895 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM895 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38261] It is appreciated that specific functions, and accordingly utilities, of GR2795 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2795 gene: GAM894 target protein and GAM895 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM894 and GAM895

[38262] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2796(GR2796) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38263] GR2796 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2796 gene was detected is described hereinabove with reference to Figs. 6-15.

[38264] GR2796 gene encodes GR2796 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38265] GR2796 precursor RNA folds spatially, forming GR2796 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2796 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2796 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38266] GR2796 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM901 precursor RNA and GAM902 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38267] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM901 RNA and GAM902 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38268] GAM901 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM901 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM901 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM901 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38269] GAM902 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM902 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM902 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM902 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38270] It is appreciated that specific functions, and accordingly utilities, of GR2796

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2796 gene: GAM901 target protein and GAM902 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM901 and GAM902

[38271] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2797 (GR2797) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38272] GR2797 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2797 gene was detected is described hereinabove with reference to Figs. 6-15.

[38273] GR2797 gene encodes GR2797 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38274] GR2797 precursor RNA folds spatially, forming GR2797 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2797 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2797 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38275] GR2797 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM909 precursor RNA and GAM910 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38276] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM909 RNA and GAM910 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38277] GAM909 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM909 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM909 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM909 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38278] GAM910 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM910 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM910 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM910 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38279] It is appreciated that specific functions, and accordingly utilities, of GR2797 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2797 gene: GAM909 target protein and GAM910 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM909 and GAM910

[38280] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2798 (GR2798) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38281] GR2798 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2798 gene was detected is described hereinabove with reference to Figs. 6-15.

[38282] GR2798 gene encodes GR2798 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38283] GR2798 precursor RNA folds spatially, forming GR2798 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2798 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2798 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38284] GR2798 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM911 precursor RNA and GAM912 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38285] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM911 RNA and GAM912 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38286] GAM911 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM911 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM911 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM911 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38287] GAM912 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM912 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM912 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM912 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38288] It is appreciated that specific functions, and accordingly utilities, of GR2798 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2798 gene: GAM911 target protein and GAM912 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM911 and GAM912

- [38289] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2799 (GR2799) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38290] GR2799 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2799 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38291] GR2799 gene encodes GR2799 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38292] GR2799 precursor RNA folds spatially, forming GR2799 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2799 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2799 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

- [38293] GR2799 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM917 precursor RNA and GAM918 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38294] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM917 RNA and GAM918 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38295] GAM917 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM917 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM917 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM917 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [38296] GAM918 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM918 target RNA, herein schematically represented by GAM2 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM918 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM918 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38297] It is appreciated that specific functions, and accordingly utilities, of GR2799 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2799 gene: GAM917 target protein and GAM918 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM917 and GAM918

[38298] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2800 (GR2800) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38299] GR2800 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2800 gene was detected is described hereinabove with reference to Figs. 6-15.

[38300] GR2800 gene encodes GR2800 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38301] GR2800 precursor RNA folds spatially, forming GR2800 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2800 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2800 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38302] GR2800 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM932 precursor RNA and GAM933 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38303] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM932 RNA and GAM933 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38304] GAM932 RNA, herein schematically represented by GAM1 binds

complimentarily to a target binding site located in an untranslated region of GAM932 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM932 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM932 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38305] GAM933 RNA, herein schematically represented by GAM2 binds complimentarily to a target binding site located in an untranslated region of GAM933 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM933 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM933 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38306] It is appreciated that specific functions, and accordingly utilities, of GR2800 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2800 gene: GAM932 target protein and GAM933 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM932 and GAM933

[38307] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record

2801(GR2801) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38308] GR2801 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2801 gene was detected is described hereinabove with reference to Figs. 6-15.

[38309] GR2801 gene encodes GR2801 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38310] GR2801 precursor RNA folds spatially, forming GR2801 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2801 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2801 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38311] GR2801 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM934 precursor RNA and

GAM935 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38312] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM934 RNA and GAM935 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38313] GAM934 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM934 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM934 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM934 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38314] GAM935 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM935 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM935 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM935 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38315] It is appreciated that specific functions, and accordingly utilities, of GR2801 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2801 gene: GAM934 target protein and GAM935 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM934 and GAM935

[38316] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2802 (GR2802) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38317] GR2802 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2802 gene was detected is described hereinabove with reference to Figs. 6-15.

[38318] GR2802 gene encodes GR2802 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38319] GR2802 precursor RNA folds spatially, forming GR2802 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2802 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2802 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38320] GR2802 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM942 precursor RNA and GAM943 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38321] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM942 RNA and GAM943 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38322] GAM942 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM942 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM942 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM942 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38323] GAM943 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM943 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM943 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM943 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38324] It is appreciated that specific functions, and accordingly utilities, of GR2802 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2802 gene: GAM942 target protein and GAM943 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM942 and GAM943

[38325] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2803 (GR2803) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[38326] GR2803 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2803 gene was detected is described hereinabove with reference to Figs. 6-15.

[38327] GR2803 gene encodes GR2803 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38328] GR2803 precursor RNA folds spatially, forming GR2803 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2803 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2803 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38329] GR2803 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM950 precursor RNA and GAM951 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

GAM PRECURSOR RNA of Fig. 8.

[38330] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM950 RNA and GAM951 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38331] GAM950 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM950 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM950 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM950 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38332] GAM951 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM951 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM951 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM951 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38333] It is appreciated that specific functions, and accordingly utilities, of GR2803 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2803 gene: GAM950 target protein and GAM951 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM950 and GAM951

[38334] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2804 (GR2804) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38335] GR2804 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2804 gene was detected is described hereinabove with reference to Figs. 6-15.

[38336] GR2804 gene encodes GR2804 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38337] GR2804 precursor RNA folds spatially, forming GR2804 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2804 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2804 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38338] GR2804 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM953 precursor RNA and GAM954 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38339] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM953 RNA and GAM954 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38340] GAM953 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM953 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM953 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM953 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38341] GAM954 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM954 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM954 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM954 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38342] It is appreciated that specific functions, and accordingly utilities, of GR2804 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2804 gene: GAM953 target protein and GAM954 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM953 and GAM954

[38343] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2805 (GR2805) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38344] GR2805 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2805 gene was detected is described hereinabove with reference to Figs. 6-15.

[38345] GR2805 gene encodes GR2805 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38346] GR2805 precursor RNA folds spatially, forming GR2805 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2805 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2805 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38347] GR2805 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM957 precursor RNA and GAM958 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38348] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM957 RNA and GAM958 RNA respectively, herein schematically

represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38349] GAM957 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM957 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM957 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM957 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38350] GAM958 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM958 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM958 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM958 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38351] It is appreciated that specific functions, and accordingly utilities, of GR2805 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2805 gene: GAM957 target protein and GAM958 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM957 and GAM958

- [38352] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2806 (GR2806) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38353] GR2806 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2806 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38354] GR2806 gene encodes GR2806 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38355] GR2806 precursor RNA folds spatially, forming GR2806 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2806 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2806 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [38356] GR2806 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM965 precursor RNA and GAM966 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38357] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM965 RNA and GAM966 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38358] GAM965 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM965 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM965 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM965 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [38359] GAM966 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM966 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM966 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM966 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38360] It is appreciated that specific functions, and accordingly utilities, of GR2806 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2806 gene: GAM965 target protein and GAM966 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM965 and GAM966

[38361] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2807 (GR2807) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38362] GR2807 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2807 gene was detected is described hereinabove with reference to Figs. 6-15.

[38363] GR2807 gene encodes GR2807 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[38364] GR2807 precursor RNA folds spatially, forming GR2807 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2807 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2807 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38365] GR2807 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM969 precursor RNA and GAM970 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38366] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM969 RNA and GAM970 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38367] GAM969 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM969 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM969 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM969 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38368] GAM970 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM970 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM970 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM970 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38369] It is appreciated that specific functions, and accordingly utilities, of GR2807 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2807 gene: GAM969 target protein and GAM970 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM969 and GAM970

[38370] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2808(GR2808) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38371] GR2808 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2808 gene was detected is described hereinabove with reference to Figs. 6-15.

[38372] GR2808 gene encodes GR2808 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38373] GR2808 precursor RNA folds spatially, forming GR2808 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2808 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2808 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38374] GR2808 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM972 precursor RNA and GAM973 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38375] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM972 RNA and GAM973 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38376] GAM972 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM972 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM972 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM972 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38377] GAM973 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM973 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM973 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM973 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38378] It is appreciated that specific functions, and accordingly utilities, of GR2808 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2808 gene: GAM972 target protein and GAM973 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM972 and GAM973

[38379] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2809 (GR2809) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38380] GR2809 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2809 gene was detected is described hereinabove with reference to Figs. 6-15.

[38381] GR2809 gene encodes GR2809 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38382] GR2809 precursor RNA folds spatially, forming GR2809 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2809 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2809 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38383] GR2809 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM974 precursor RNA, GAM975 precursor RNA and GAM976 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38384] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM974 RNA, GAM975 RNA and GAM976 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38385] GAM974 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM974 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM974 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM974 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38386] GAM975 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM975 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM975 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM975 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38387] GAM976 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM976 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM976 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM976 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38388] It is appreciated that specific functions, and accordingly utilities, of GR2809 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2809 gene: GAM974 target

protein, GAM975 target protein and GAM976 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM974, GAM975 and GAM976

[38389] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2810(GR2810) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38390] GR2810 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2810 gene was detected is described hereinabove with reference to Figs. 6-15.

[38391] GR2810 gene encodes GR2810 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38392] GR2810 precursor RNA folds spatially, forming GR2810 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2810 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2810 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38393] GR2810 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM980 precursor RNA and GAM981 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38394] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM980 RNA and GAM981 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38395] GAM980 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM980 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM980 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM980 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38396] GAM981 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM981 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM981 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM981 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38397] It is appreciated that specific functions, and accordingly utilities, of GR2810 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2810 gene: GAM980 target protein and GAM981 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM980 and GAM981

[38398] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2811 (GR2811) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38399] GR2811 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2811 gene was detected is described hereinabove with reference to Figs. 6-15.

[38400] GR2811 gene encodes GR2811 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38401] GR2811 precursor RNA folds spatially, forming GR2811 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2811 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2811 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38402] GR2811 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM985 precursor RNA and GAM986 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38403] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM985 RNA and GAM986 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38404] GAM985 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM985 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM985 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM985 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38405] GAM986 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM986 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM986 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM986 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38406] It is appreciated that specific functions, and accordingly utilities, of GR2811 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2811 gene: GAM985 target protein and GAM986 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM985 and GAM986

- [38407] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2812(GR2812) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38408] GR2812 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2812 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38409] GR2812 gene encodes GR2812 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38410] GR2812 precursor RNA folds spatially, forming GR2812 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2812 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2812 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38411] GR2812 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 3 separate GAM precursor RNAs, GAM989 precursor RNA, GAM990 precursor RNA and GAM991 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38412] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM989 RNA, GAM990 RNA and GAM991 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38413] GAM989 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM989 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM989 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM989 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38414] GAM990 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM990 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM990 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM990 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38415] GAM991 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM991 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM991 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM991 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38416] It is appreciated that specific functions, and accordingly utilities, of GR2812 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2812 gene: GAM989 target protein, GAM990 target protein and GAM991 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM989, GAM990 and GAM991

[38417] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2813(GR2813) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[38418] GR2813 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2813 gene was detected is described hereinabove with reference to Figs. 6-15.

[38419] GR2813 gene encodes GR2813 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38420] GR2813 precursor RNA folds spatially, forming GR2813 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2813 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2813 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38421] GR2813 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM993 precursor RNA and GAM994 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

GAM PRECURSOR RNA of Fig. 8.

[38422] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM993 RNA and GAM994 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38423] GAM993 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM993 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM993 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM993 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38424] GAM994 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM994 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM994 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM994 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38425] It is appreciated that specific functions, and accordingly utilities, of GR2813 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2813 gene: GAM993 target protein and GAM994 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM993 and GAM994

[38426] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2814 (GR2814) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38427] GR2814 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2814 gene was detected is described hereinabove with reference to Figs. 6-15.

[38428] GR2814 gene encodes GR2814 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38429] GR2814 precursor RNA folds spatially, forming GR2814 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2814 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2814 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38430] GR2814 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1002 precursor RNA and GAM1003 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38431] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1002 RNA and GAM1003 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38432] GAM1002 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1002 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1002 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1002 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38433] GAM1003 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1003 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1003 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1003 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38434] It is appreciated that specific functions, and accordingly utilities, of GR2814 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2814 gene: GAM1002 target protein and GAM1003 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1002 and GAM1003

[38435] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2815 (GR2815) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38436] GR2815 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2815 gene was detected is described hereinabove with reference to Figs. 6-15.

[38437] GR2815 gene encodes GR2815 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38438] GR2815 precursor RNA folds spatially, forming GR2815 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2815 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2815 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38439] GR2815 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1013 precursor RNA and GAM1014 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38440] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1013 RNA and GAM1014 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38441] GAM1013 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1013 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1013 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1013 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38442] GAM1014 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1014 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1014 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1014 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38443] It is appreciated that specific functions, and accordingly utilities, of GR2815 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2815 gene: GAM1013 target protein and GAM1014 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM1013 and GAM1014

- [38444] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2816 (GR2816) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38445] GR2816 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2816 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38446] GR2816 gene encodes GR2816 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38447] GR2816 precursor RNA folds spatially, forming GR2816 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2816 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2816 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38448] GR2816 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1018 precursor RNA and GAM1019 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38449] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1018 RNA and GAM1019 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38450] GAM1018 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1018 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1018 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1018 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38451] GAM1019 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1019 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1019 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1019 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38452] It is appreciated that specific functions, and accordingly utilities, of GR2816 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2816 gene: GAM1018 target protein and GAM1019 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1018 and GAM1019

[38453] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2817 (GR2817) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38454] GR2817 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2817 gene was detected is described hereinabove with reference to Figs. 6-15.

[38455] GR2817 gene encodes GR2817 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[38456] GR2817 precursor RNA folds spatially, forming GR2817 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2817 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2817 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38457] GR2817 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1020 precursor RNA and GAM1021 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38458] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1020 RNA and GAM1021 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38459] GAM1020 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1020 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1020 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1020 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38460] GAM1021 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1021 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1021 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1021 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38461] It is appreciated that specific functions, and accordingly utilities, of GR2817 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2817 gene: GAM1020 target protein and GAM1021 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1020 and GAM1021

[38462] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2818(GR2818) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38463] GR2818 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2818 gene was detected is described hereinabove with reference to Figs. 6-15.

[38464] GR2818 gene encodes GR2818 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38465] GR2818 precursor RNA folds spatially, forming GR2818 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2818 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2818 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38466] GR2818 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1027 precursor RNA, GAM1028 precursor RNA and GAM1029 precursor RNA, herein

schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38467] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1027 RNA, GAM1028 RNA and GAM1029 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38468] GAM1027 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1027 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1027 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1027 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38469] GAM1028 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1028 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1028 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1028 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38470] GAM1029 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1029 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1029 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1029 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38471] It is appreciated that specific functions, and accordingly utilities, of GR2818 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2818 gene: GAM1027 target protein, GAM1028 target protein and GAM1029 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1027, GAM1028 and GAM1029

[38472] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2819(GR2819) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is

known in the art.

[38473] GR2819 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2819 gene was detected is described hereinabove with reference to Figs. 6-15.

[38474] GR2819 gene encodes GR2819 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38475] GR2819 precursor RNA folds spatially, forming GR2819 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2819 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2819 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38476] GR2819 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1032 precursor RNA and GAM1033 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38477] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1032 RNA and GAM1033 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38478] GAM1032 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1032 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1032 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1032 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38479] GAM1033 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1033 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1033 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1033 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38480] It is appreciated that specific functions, and accordingly utilities, of GR2819 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs

comprised in the operon-like cluster of GR2819 gene: GAM1032 target protein and GAM1033 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1032 and GAM1033

[38481] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2820 (GR2820) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38482] GR2820 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2820 gene was detected is described hereinabove with reference to Figs. 6-15.

[38483] GR2820 gene encodes GR2820 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38484] GR2820 precursor RNA folds spatially, forming GR2820 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2820 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2820 precursor RNA comprises a plurality of

segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38485] GR2820 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1036 precursor RNA and GAM1037 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38486] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1036 RNA and GAM1037 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38487] GAM1036 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1036 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1036 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1036 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38488] GAM1037 RNA, herein schematically represented by GAM2 binds

complimentarily to a target binding site located in an untranslated region of GAM1037 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1037 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1037 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38489] It is appreciated that specific functions, and accordingly utilities, of GR2820 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2820 gene: GAM1036 target protein and GAM1037 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1036 and GAM1037

[38490] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2821 (GR2821) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38491] GR2821 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2821 gene was detected is described hereinabove with reference to Figs.

- [38492] GR2821 gene encodes GR2821 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38493] GR2821 precursor RNA folds spatially, forming GR2821 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2821 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2821 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38494] GR2821 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1041 precursor RNA and GAM1042 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38495] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1041 RNA and GAM1042 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively,

each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38496] GAM1041 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1041 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1041 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1041 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38497] GAM1042 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1042 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1042 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1042 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38498] It is appreciated that specific functions, and accordingly utilities, of GR2821 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2821 gene: GAM1041 target protein and GAM1042 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to

- [38499] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2822(GR2822) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38500] GR2822 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2822 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38501] GR2822 gene encodes GR2822 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38502] GR2822 precursor RNA folds spatially, forming GR2822 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2822 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2822 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [38503] GR2822 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1051 precursor RNA, GAM1052 precursor RNA and GAM1053 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38504] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1051 RNA, GAM1052 RNA and GAM1053 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38505] GAM1051 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1051 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1051 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1051 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [38506] GAM1052 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1052 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1052 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1052 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38507] GAM1053 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1053 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1053 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1053 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38508] It is appreciated that specific functions, and accordingly utilities, of GR2822 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2822 gene: GAM1051 target protein, GAM1052 target protein and GAM1053 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1051, GAM1052 and GAM1053

[38509] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record

2823(GR2823) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38510] GR2823 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2823 gene was detected is described hereinabove with reference to Figs. 6-15.

[38511] GR2823 gene encodes GR2823 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38512] GR2823 precursor RNA folds spatially, forming GR2823 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2823 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2823 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38513] GR2823 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1054 precursor RNA,

GAM1055 precursor RNA and GAM1056 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38514] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1054 RNA, GAM1055 RNA and GAM1056 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38515] GAM1054 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1054 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1054 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1054 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38516] GAM1055 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1055 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby

inhibiting translation of GAM1055 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1055 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38517] GAM1056 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1056 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1056 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1056 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38518] It is appreciated that specific functions, and accordingly utilities, of GR2823 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2823 gene: GAM1054 target protein, GAM1055 target protein and GAM1056 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1054, GAM1055 and GAM1056

[38519] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2824(GR2824) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[38520] GR2824 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2824 gene was detected is described hereinabove with reference to Figs. 6-15.

[38521] GR2824 gene encodes GR2824 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38522] GR2824 precursor RNA folds spatially, forming GR2824 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2824 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2824 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38523] GR2824 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1060 precursor RNA and GAM1061 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

## GAM PRECURSOR RNA of Fig. 8.

[38524] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1060 RNA and GAM1061 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38525] GAM1060 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1060 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1060 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1060 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38526] GAM1061 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1061 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1061 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1061 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38527] It is appreciated that specific functions, and accordingly utilities, of GR2824 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2824 gene: GAM1060 target protein and GAM1061 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1060 and GAM1061

[38528] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2825 (GR2825) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38529] GR2825 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2825 gene was detected is described hereinabove with reference to Figs. 6-15.

[38530] GR2825 gene encodes GR2825 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38531] GR2825 precursor RNA folds spatially, forming GR2825 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2825 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2825 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38532] GR2825 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1070 precursor RNA and GAM1071 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38533] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1070 RNA and GAM1071 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38534] GAM1070 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1070 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1070 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1070 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38535] GAM1071 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1071 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1071 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1071 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38536] It is appreciated that specific functions, and accordingly utilities, of GR2825 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2825 gene: GAM1070 target protein and GAM1071 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1070 and GAM1071

[38537] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2826 (GR2826) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38538] GR2826 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2826 gene was detected is described hereinabove with reference to Figs. 6-15.

[38539] GR2826 gene encodes GR2826 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38540] GR2826 precursor RNA folds spatially, forming GR2826 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2826 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2826 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38541] GR2826 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1080 precursor RNA and GAM1081 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38542] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1080 RNA and GAM1081 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38543] GAM1080 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1080 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1080 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1080 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38544] GAM1081 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1081 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1081 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1081 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38545] It is appreciated that specific functions, and accordingly utilities, of GR2826 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2826 gene: GAM1080 target protein and GAM1081 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM1080 and GAM1081

- [38546] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2827 (GR2827) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38547] GR2827 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2827 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38548] GR2827 gene encodes GR2827 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38549] GR2827 precursor RNA folds spatially, forming GR2827 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2827 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2827 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [38550] GR2827 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1093 precursor RNA and GAM1094 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38551] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1093 RNA and GAM1094 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38552] GAM1093 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1093 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1093 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1093 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [38553] GAM1094 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1094 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1094 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1094 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38554] It is appreciated that specific functions, and accordingly utilities, of GR2827 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2827 gene: GAM1093 target protein and GAM1094 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1093 and GAM1094

[38555] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2828 (GR2828) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38556] GR2828 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2828 gene was detected is described hereinabove with reference to Figs. 6-15.

[38557] GR2828 gene encodes GR2828 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[38558] GR2828 precursor RNA folds spatially, forming GR2828 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2828 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2828 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38559] GR2828 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1095 precursor RNA and GAM1096 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38560] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1095 RNA and GAM1096 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38561] GAM1095 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1095 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1095 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1095 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38562] GAM1096 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1096 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1096 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1096 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38563] It is appreciated that specific functions, and accordingly utilities, of GR2828 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2828 gene: GAM1095 target protein and GAM1096 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1095 and GAM1096

[38564] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2829(GR2829) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38565] GR2829 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2829 gene was detected is described hereinabove with reference to Figs. 6-15.

[38566] GR2829 gene encodes GR2829 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38567] GR2829 precursor RNA folds spatially, forming GR2829 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2829 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2829 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38568] GR2829 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1097 precursor RNA and GAM1098 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38569] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1097 RNA and GAM1098 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38570] GAM1097 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1097 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1097 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1097 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38571] GAM1098 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1098 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1098 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1098 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38572] It is appreciated that specific functions, and accordingly utilities, of GR2829 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2829 gene: GAM1097 target protein and GAM1098 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1097 and GAM1098

[38573] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2830 (GR2830) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38574] GR2830 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2830 gene was detected is described hereinabove with reference to Figs. 6-15.

[38575] GR2830 gene encodes GR2830 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38576] GR2830 precursor RNA folds spatially, forming GR2830 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2830 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2830 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38577] GR2830 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1099 precursor RNA and GAM1100 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38578] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1099 RNA and GAM1100 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38579] GAM1099 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1099 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1099 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM1099 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38580] GAM1100 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1100 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1100 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1100 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38581] It is appreciated that specific functions, and accordingly utilities, of GR2830 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2830 gene: GAM1099 target protein and GAM1100 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1099 and GAM1100

[38582] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2831 (GR2831) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38583] GR2831 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2831 gene was detected is described hereinabove with reference to Figs. 6-15.

[38584] GR2831 gene encodes GR2831 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38585] GR2831 precursor RNA folds spatially, forming GR2831 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2831 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2831 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38586] GR2831 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1107 precursor RNA and GAM1108 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38587] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1107 RNA and GAM1108 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38588] GAM1107 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1107 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1107 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1107 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38589] GAM1108 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1108 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1108 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1108 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38590] It is appreciated that specific functions, and accordingly utilities, of GR2831 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2831 gene: GAM1107 target

protein and GAM1108 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1107 and GAM1108

[38591] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2832 (GR2832) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38592] GR2832 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2832 gene was detected is described hereinabove with reference to Figs. 6-15.

[38593] GR2832 gene encodes GR2832 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38594] GR2832 precursor RNA folds spatially, forming GR2832 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2832 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2832 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38595] GR2832 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1114 precursor RNA and GAM1115 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38596] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1114 RNA and GAM1115 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38597] GAM1114 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1114 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1114 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1114 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38598] GAM1115 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1115 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1115 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1115 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38599] It is appreciated that specific functions, and accordingly utilities, of GR2832 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2832 gene: GAM1114 target protein and GAM1115 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1114 and GAM1115

[38600] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2833 (GR2833) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38601] GR2833 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2833 gene was detected is described hereinabove with reference to Figs. 6-15.

[38602] GR2833 gene encodes GR2833 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38603] GR2833 precursor RNA folds spatially, forming GR2833 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2833 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2833 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38604] GR2833 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1129 precursor RNA and GAM1130 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38605] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1129 RNA and GAM1130 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38606] GAM1129 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1129 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1129 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1129 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38607] GAM1130 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1130 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1130 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1130 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38608] It is appreciated that specific functions, and accordingly utilities, of GR2833 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2833 gene: GAM1129 target protein and GAM1130 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1129 and GAM1130

- [38609] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2834(GR2834) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38610] GR2834 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2834 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38611] GR2834 gene encodes GR2834 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38612] GR2834 precursor RNA folds spatially, forming GR2834 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2834 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2834 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38613] GR2834 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM1145 precursor RNA and GAM1146 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38614] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1145 RNA and GAM1146 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38615] GAM1145 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1145 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1145 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1145 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38616] GAM1146 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1146 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1146 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1146 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38617] It is appreciated that specific functions, and accordingly utilities, of GR2834 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2834 gene: GAM1145 target protein and GAM1146 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1145 and GAM1146

[38618] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2835 (GR2835) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38619] GR2835 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2835 gene was detected is described hereinabove with reference to Figs. 6-15.

[38620] GR2835 gene encodes GR2835 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38621] GR2835 precursor RNA folds spatially, forming GR2835 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2835 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2835 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38622] GR2835 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1151 precursor RNA and GAM1152 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38623] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1151 RNA and GAM1152 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38624] GAM1151 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1151 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1151 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1151 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38625] GAM1152 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1152 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1152 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1152 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38626] It is appreciated that specific functions, and accordingly utilities, of GR2835 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2835 gene: GAM1151 target protein and GAM1152 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1151 and GAM1152

[38627] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2836(GR2836) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38628] GR2836 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2836 gene was detected is described hereinabove with reference to Figs. 6-15.

[38629] GR2836 gene encodes GR2836 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38630] GR2836 precursor RNA folds spatially, forming GR2836 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2836 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2836 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38631] GR2836 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1153 precursor RNA and GAM1154 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38632] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1153 RNA and GAM1154 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38633] GAM1153 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1153 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1153 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1153 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38634] GAM1154 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1154 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1154 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1154 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38635] It is appreciated that specific functions, and accordingly utilities, of GR2836

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2836 gene: GAM1153 target protein and GAM1154 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1153 and GAM1154

[38636] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2837 (GR2837) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38637] GR2837 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2837 gene was detected is described hereinabove with reference to Figs. 6-15.

[38638] GR2837 gene encodes GR2837 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38639] GR2837 precursor RNA folds spatially, forming GR2837 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2837 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2837 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38640] GR2837 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1156 precursor RNA and GAM1157 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38641] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1156 RNA and GAM1157 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38642] GAM1156 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1156 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1156 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1156 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38643] GAM1157 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1157 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1157 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1157 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38644] It is appreciated that specific functions, and accordingly utilities, of GR2837 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2837 gene: GAM1156 target protein and GAM1157 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1156 and GAM1157

[38645] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2838 (GR2838) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38646] GR2838 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2838 gene was detected is described hereinabove with reference to Figs. 6-15.

[38647] GR2838 gene encodes GR2838 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38648] GR2838 precursor RNA folds spatially, forming GR2838 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2838 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2838 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38649] GR2838 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1162 precursor RNA and GAM1163 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38650] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM1162 RNA and GAM1163 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38651] GAM1162 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1162 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1162 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1162 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38652] GAM1163 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1163 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1163 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1163 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38653] It is appreciated that specific functions, and accordingly utilities, of GR2838 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2838 gene: GAM1162 target protein and GAM1163 target protein, herein schematically represented by

GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1162 and GAM1163

[38654] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2839 (GR2839) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38655] GR2839 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2839 gene was detected is described hereinabove with reference to Figs. 6-15.

[38656] GR2839 gene encodes GR2839 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38657] GR2839 precursor RNA folds spatially, forming GR2839 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2839 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2839 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half

thereof, as is well known in the art.

[38658] GR2839 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM1168 precursor RNA, GAM1169 precursor RNA, GAM1170 precursor RNA and GAM1171 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR, GAM3 PRECURSOR and GAM4 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38659] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1168 RNA, GAM1169 RNA, GAM1170 RNA and GAM1171 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA, GAM3 RNA and GAM4 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38660] GAM1168 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1168 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1168 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1168 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38661] GAM1169 RNA, herein schematically represented by GAM2 binds

complimentarily to a target binding site located in an untranslated region of GAM1169 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1169 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1169 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38662] GAM1170 RNA, herein schematically represented by GAM3 binds complimentarily to a target binding site located in an untranslated region of GAM1170 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1170 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1170 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38663] GAM1171 RNA, herein schematically represented by GAM4 binds complimentarily to a target binding site located in an untranslated region of GAM1171 target RNA, herein schematically represented by GAM4 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1171 target RNA, herein schematically represented by GAM4 TARGET RNA into GAM1171 target protein, herein schematically represented by GAM4 TARGET PROTEIN, both of Fig. 8.

[38664] It is appreciated that specific functions, and accordingly utilities, of GR2839

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2839 gene: GAM1168 target protein, GAM1169 target protein, GAM1170 target protein and GAM1171 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1168, GAM1169, GAM1170 and GAM1171

[38665] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2840(GR2840) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38666] GR2840 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2840 gene was detected is described hereinabove with reference to Figs. 6-15.

[38667] GR2840 gene encodes GR2840 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38668] GR2840 precursor RNA folds spatially, forming GR2840 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2840 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2840 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38669] GR2840 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1183 precursor RNA and GAM1184 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38670] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1183 RNA and GAM1184 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38671] GAM1183 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1183 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1183 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM1183 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38672] GAM1184 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1184 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1184 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1184 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38673] It is appreciated that specific functions, and accordingly utilities, of GR2840 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2840 gene: GAM1183 target protein and GAM1184 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1183 and GAM1184

[38674] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2841 (GR2841) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38675] GR2841 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2841 gene was detected is described hereinabove with reference to Figs. 6-15.

[38676] GR2841 gene encodes GR2841 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38677] GR2841 precursor RNA folds spatially, forming GR2841 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2841 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2841 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38678] GR2841 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1188 precursor RNA and GAM1189 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38679] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1188 RNA and GAM1189 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38680] GAM1188 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1188 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1188 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1188 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38681] GAM1189 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1189 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1189 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1189 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38682] It is appreciated that specific functions, and accordingly utilities, of GR2841 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2841 gene: GAM1188 target

protein and GAM1189 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1188 and GAM1189

[38683] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2842 (GR2842) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38684] GR2842 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2842 gene was detected is described hereinabove with reference to Figs. 6-15.

[38685] GR2842 gene encodes GR2842 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38686] GR2842 precursor RNA folds spatially, forming GR2842 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2842 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2842 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38687] GR2842 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1193 precursor RNA and GAM1194 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38688] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1193 RNA and GAM1194 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38689] GAM1193 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1193 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1193 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1193 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38690] GAM1194 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1194 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1194 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1194 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38691] It is appreciated that specific functions, and accordingly utilities, of GR2842 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2842 gene: GAM1193 target protein and GAM1194 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1193 and GAM1194

[38692] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2843 (GR2843) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38693] GR2843 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2843 gene was detected is described hereinabove with reference to Figs. 6-15.

[38694] GR2843 gene encodes GR2843 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38695] GR2843 precursor RNA folds spatially, forming GR2843 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2843 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2843 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38696] GR2843 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1200 precursor RNA and GAM1201 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38697] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1200 RNA and GAM1201 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38698] GAM1200 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1200 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1200 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1200 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38699] GAM1201 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1201 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1201 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1201 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38700] It is appreciated that specific functions, and accordingly utilities, of GR2843 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2843 gene: GAM1200 target protein and GAM1201 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1200 and GAM1201

- [38701] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2844(GR2844) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38702] GR2844 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2844 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38703] GR2844 gene encodes GR2844 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38704] GR2844 precursor RNA folds spatially, forming GR2844 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2844 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2844 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38705] GR2844 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM1203 precursor RNA and GAM1204 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38706] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1203 RNA and GAM1204 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38707] GAM1203 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1203 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1203 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1203 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38708] GAM1204 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1204 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1204 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1204 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38709] It is appreciated that specific functions, and accordingly utilities, of GR2844 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2844 gene: GAM1203 target protein and GAM1204 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1203 and GAM1204

[38710] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2845 (GR2845) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38711] GR2845 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2845 gene was detected is described hereinabove with reference to Figs. 6-15.

[38712] GR2845 gene encodes GR2845 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38713] GR2845 precursor RNA folds spatially, forming GR2845 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2845 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2845 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38714] GR2845 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1211 precursor RNA and GAM1212 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38715] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1211 RNA and GAM1212 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38716] GAM1211 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1211 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1211 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1211 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38717] GAM1212 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1212 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1212 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1212 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38718] It is appreciated that specific functions, and accordingly utilities, of GR2845 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2845 gene: GAM1211 target protein and GAM1212 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1211 and GAM1212

[38719] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2846(GR2846) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38720] GR2846 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2846 gene was detected is described hereinabove with reference to Figs. 6-15.

[38721] GR2846 gene encodes GR2846 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38722] GR2846 precursor RNA folds spatially, forming GR2846 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2846 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2846 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38723] GR2846 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1220 precursor RNA, GAM1221 precursor RNA and GAM1222 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR

and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38724] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1220 RNA, GAM1221 RNA and GAM1222 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38725] GAM1220 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1220 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1220 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1220 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38726] GAM1221 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1221 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1221 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1221 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38727] GAM1222 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1222 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1222 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1222 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38728] It is appreciated that specific functions, and accordingly utilities, of GR2846 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2846 gene: GAM1220 target protein, GAM1221 target protein and GAM1222 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1220, GAM1221 and GAM1222

[38729] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2847(GR2847) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

- [38730] GR2847 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2847 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38731] GR2847 gene encodes GR2847 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38732] GR2847 precursor RNA folds spatially, forming GR2847 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2847 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2847 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38733] GR2847 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1223 precursor RNA and GAM1224 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38734] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1223 RNA and GAM1224 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38735] GAM1223 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1223 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1223 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1223 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38736] GAM1224 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1224 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1224 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1224 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38737] It is appreciated that specific functions, and accordingly utilities, of GR2847 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2847 gene: GAM1223 target

protein and GAM1224 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1223 and GAM1224

[38738] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2848 (GR2848) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38739] GR2848 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2848 gene was detected is described hereinabove with reference to Figs. 6-15.

[38740] GR2848 gene encodes GR2848 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38741] GR2848 precursor RNA folds spatially, forming GR2848 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2848 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2848 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38742] GR2848 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1227 precursor RNA and GAM1228 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38743] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1227 RNA and GAM1228 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38744] GAM1227 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1227 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1227 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1227 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38745] GAM1228 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1228 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1228 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1228 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38746] It is appreciated that specific functions, and accordingly utilities, of GR2848 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2848 gene: GAM1227 target protein and GAM1228 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1227 and GAM1228

[38747] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2849 (GR2849) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

- [38748] GR2849 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2849 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38749] GR2849 gene encodes GR2849 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38750] GR2849 precursor RNA folds spatially, forming GR2849 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2849 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2849 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38751] GR2849 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1233 precursor RNA, GAM1234 precursor RNA and GAM1235 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38752] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1233 RNA, GAM1234 RNA and GAM1235 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38753] GAM1233 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1233 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1233 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1233 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38754] GAM1234 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1234 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1234 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1234 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38755] GAM1235 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of

GAM1235 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1235 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1235 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38756] It is appreciated that specific functions, and accordingly utilities, of GR2849 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2849 gene: GAM1233 target protein, GAM1234 target protein and GAM1235 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1233, GAM1234 and GAM1235

[38757] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2850 (GR2850) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38758] GR2850 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2850 gene was detected is described hereinabove with reference to Figs.

- [38759] GR2850 gene encodes GR2850 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38760] GR2850 precursor RNA folds spatially, forming GR2850 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2850 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2850 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38761] GR2850 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1249 precursor RNA and GAM1250 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38762] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1249 RNA and GAM1250 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively,

each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38763] GAM1249 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1249 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1249 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1249 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38764] GAM1250 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1250 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1250 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1250 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38765] It is appreciated that specific functions, and accordingly utilities, of GR2850 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2850 gene: GAM1249 target protein and GAM1250 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to

- [38766] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2851 (GR2851) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38767] GR2851 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2851 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38768] GR2851 gene encodes GR2851 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38769] GR2851 precursor RNA folds spatially, forming GR2851 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2851 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2851 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [38770] GR2851 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1254 precursor RNA and GAM1255 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38771] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1254 RNA and GAM1255 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38772] GAM1254 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1254 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1254 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1254 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [38773] GAM1255 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1255 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1255 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1255 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38774] It is appreciated that specific functions, and accordingly utilities, of GR2851 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2851 gene: GAM1254 target protein and GAM1255 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1254 and GAM1255

[38775] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2852 (GR2852) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38776] GR2852 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2852 gene was detected is described hereinabove with reference to Figs. 6-15.

[38777] GR2852 gene encodes GR2852 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[38778] GR2852 precursor RNA folds spatially, forming GR2852 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2852 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2852 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38779] GR2852 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1256 precursor RNA and GAM1257 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38780] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1256 RNA and GAM1257 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38781] GAM1256 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1256 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1256 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1256 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38782] GAM1257 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1257 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1257 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1257 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38783] It is appreciated that specific functions, and accordingly utilities, of GR2852 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2852 gene: GAM1256 target protein and GAM1257 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1256 and GAM1257

[38784] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2853(GR2853) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38785] GR2853 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2853 gene was detected is described hereinabove with reference to Figs. 6-15.

[38786] GR2853 gene encodes GR2853 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38787] GR2853 precursor RNA folds spatially, forming GR2853 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2853 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2853 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38788] GR2853 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1260 precursor RNA, GAM1261 precursor RNA and GAM1262 precursor RNA, herein

schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38789] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1260 RNA, GAM1261 RNA and GAM1262 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38790] GAM1260 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1260 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1260 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1260 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38791] GAM1261 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1261 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1261 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1261 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38792] GAM1262 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1262 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1262 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1262 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38793] It is appreciated that specific functions, and accordingly utilities, of GR2853 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2853 gene: GAM1260 target protein, GAM1261 target protein and GAM1262 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1260, GAM1261 and GAM1262

[38794] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2854(GR2854) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is

known in the art.

[38795] GR2854 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2854 gene was detected is described hereinabove with reference to Figs. 6-15.

[38796] GR2854 gene encodes GR2854 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38797] GR2854 precursor RNA folds spatially, forming GR2854 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2854 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2854 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38798] GR2854 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1263 precursor RNA and GAM1264 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38799] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1263 RNA and GAM1264 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38800] GAM1263 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1263 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1263 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1263 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38801] GAM1264 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1264 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1264 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1264 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38802] It is appreciated that specific functions, and accordingly utilities, of GR2854 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs

comprised in the operon-like cluster of GR2854 gene: GAM1263 target protein and GAM1264 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1263 and GAM1264

[38803] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2855 (GR2855) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38804] GR2855 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2855 gene was detected is described hereinabove with reference to Figs. 6-15.

[38805] GR2855 gene encodes GR2855 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38806] GR2855 precursor RNA folds spatially, forming GR2855 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2855 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2855 precursor RNA comprises a plurality of

segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38807] GR2855 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1270 precursor RNA and GAM1271 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38808] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1270 RNA and GAM1271 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38809] GAM1270 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1270 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1270 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1270 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38810] GAM1271 RNA, herein schematically represented by GAM2 binds

complimentarily to a target binding site located in an untranslated region of GAM1271 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1271 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1271 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38811] It is appreciated that specific functions, and accordingly utilities, of GR2855 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2855 gene: GAM1270 target protein and GAM1271 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1270 and GAM1271

[38812] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2856 (GR2856) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38813] GR2856 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2856 gene was detected is described hereinabove with reference to Figs.

- [38814] GR2856 gene encodes GR2856 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38815] GR2856 precursor RNA folds spatially, forming GR2856 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2856 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2856 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38816] GR2856 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1281 precursor RNA and GAM1282 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38817] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1281 RNA and GAM1282 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively,

each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38818] GAM1281 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1281 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1281 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1281 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38819] GAM1282 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1282 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1282 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1282 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38820] It is appreciated that specific functions, and accordingly utilities, of GR2856 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2856 gene: GAM1281 target protein and GAM1282 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to

- [38821] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2857 (GR2857) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38822] GR2857 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2857 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38823] GR2857 gene encodes GR2857 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38824] GR2857 precursor RNA folds spatially, forming GR2857 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2857 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2857 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38825] GR2857 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1287 precursor RNA and GAM1288 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38826] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1287 RNA and GAM1288 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38827] GAM1287 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1287 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1287 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1287 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38828] GAM1288 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1288 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1288 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1288 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38829] It is appreciated that specific functions, and accordingly utilities, of GR2857 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2857 gene: GAM1287 target protein and GAM1288 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1287 and GAM1288

[38830] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2858 (GR2858) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38831] GR2858 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2858 gene was detected is described hereinabove with reference to Figs. 6-15.

[38832] GR2858 gene encodes GR2858 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[38833] GR2858 precursor RNA folds spatially, forming GR2858 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2858 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2858 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38834] GR2858 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1289 precursor RNA and GAM1290 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38835] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1289 RNA and GAM1290 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38836] GAM1289 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1289 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1289 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1289 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38837] GAM1290 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1290 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1290 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1290 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38838] It is appreciated that specific functions, and accordingly utilities, of GR2858 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2858 gene: GAM1289 target protein and GAM1290 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1289 and GAM1290

[38839] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2859(GR2859) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38840] GR2859 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2859 gene was detected is described hereinabove with reference to Figs. 6-15.

[38841] GR2859 gene encodes GR2859 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38842] GR2859 precursor RNA folds spatially, forming GR2859 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2859 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2859 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38843] GR2859 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1308 precursor RNA, GAM1309 precursor RNA and GAM1310 precursor RNA, herein

schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38844] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1308 RNA, GAM1309 RNA and GAM1310 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38845] GAM1308 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1308 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1308 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1308 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38846] GAM1309 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1309 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1309 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1309 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38847] GAM1310 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1310 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1310 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1310 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38848] It is appreciated that specific functions, and accordingly utilities, of GR2859 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2859 gene: GAM1308 target protein, GAM1309 target protein and GAM1310 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1308, GAM1309 and GAM1310

[38849] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2860 (GR2860) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is

known in the art.

[38850] GR2860 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2860 gene was detected is described hereinabove with reference to Figs. 6-15.

[38851] GR2860 gene encodes GR2860 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38852] GR2860 precursor RNA folds spatially, forming GR2860 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2860 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2860 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38853] GR2860 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1315 precursor RNA and GAM1316 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38854] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1315 RNA and GAM1316 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38855] GAM1315 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1315 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1315 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1315 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38856] GAM1316 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1316 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1316 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1316 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38857] It is appreciated that specific functions, and accordingly utilities, of GR2860 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs

comprised in the operon-like cluster of GR2860 gene: GAM1315 target protein and GAM1316 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1315 and GAM1316

[38858] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2861 (GR2861) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38859] GR2861 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2861 gene was detected is described hereinabove with reference to Figs. 6-15.

[38860] GR2861 gene encodes GR2861 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38861] GR2861 precursor RNA folds spatially, forming GR2861 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2861 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2861 precursor RNA comprises a plurality of

segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38862] GR2861 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1317 precursor RNA and GAM1318 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38863] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1317 RNA and GAM1318 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38864] GAM1317 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1317 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1317 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1317 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38865] GAM1318 RNA, herein schematically represented by GAM2 binds

complimentarily to a target binding site located in an untranslated region of GAM1318 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1318 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1318 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38866] It is appreciated that specific functions, and accordingly utilities, of GR2861 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2861 gene: GAM1317 target protein and GAM1318 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1317 and GAM1318

[38867] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2862 (GR2862) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38868] GR2862 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2862 gene was detected is described hereinabove with reference to Figs.

- [38869] GR2862 gene encodes GR2862 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38870] GR2862 precursor RNA folds spatially, forming GR2862 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2862 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2862 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38871] GR2862 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1321 precursor RNA and GAM1322 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38872] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1321 RNA and GAM1322 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively,

each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38873] GAM1321 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1321 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1321 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1321 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38874] GAM1322 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1322 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1322 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1322 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38875] It is appreciated that specific functions, and accordingly utilities, of GR2862 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2862 gene: GAM1321 target protein and GAM1322 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to

- [38876] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2863(GR2863) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38877] GR2863 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2863 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38878] GR2863 gene encodes GR2863 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38879] GR2863 precursor RNA folds spatially, forming GR2863 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2863 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2863 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38880] GR2863 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1326 precursor RNA, GAM1327 precursor RNA and GAM1328 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38881] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1326 RNA, GAM1327 RNA and GAM1328 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38882] GAM1326 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1326 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1326 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1326 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38883] GAM1327 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1327 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1327 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1327 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38884] GAM1328 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1328 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1328 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1328 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[38885] It is appreciated that specific functions, and accordingly utilities, of GR2863 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2863 gene: GAM1326 target protein, GAM1327 target protein and GAM1328 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1326, GAM1327 and GAM1328

[38886] Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory gene, referred to here as Genomic Record

2864(GR2864) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38887] GR2864 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2864 gene was detected is described hereinabove with reference to Figs. 6-15.

[38888] GR2864 gene encodes GR2864 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38889] GR2864 precursor RNA folds spatially, forming GR2864 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2864 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2864 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38890] GR2864 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1344 precursor RNA and

GAM1345 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38891] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1344 RNA and GAM1345 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38892] GAM1344 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1344 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1344 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1344 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38893] GAM1345 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1345 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1345 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1345 target protein, herein

schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38894] It is appreciated that specific functions, and accordingly utilities, of GR2864 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2864 gene: GAM1344 target protein and GAM1345 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1344 and GAM1345

[38895] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2865 (GR2865) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38896] GR2865 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2865 gene was detected is described hereinabove with reference to Figs. 6-15.

[38897] GR2865 gene encodes GR2865 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38898] GR2865 precursor RNA folds spatially, forming GR2865 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2865 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2865 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38899] GR2865 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1353 precursor RNA and GAM1354 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38900] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1353 RNA and GAM1354 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38901] GAM1353 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1353 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1353 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1353 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38902] GAM1354 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1354 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1354 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1354 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38903] It is appreciated that specific functions, and accordingly utilities, of GR2865 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2865 gene: GAM1353 target protein and GAM1354 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1353 and GAM1354

[38904] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2866 (GR2866) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one

target gene, the function and utility of which at least one target gene is known in the art.

[38905] GR2866 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2866 gene was detected is described hereinabove with reference to Figs. 6-15.

[38906] GR2866 gene encodes GR2866 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38907] GR2866 precursor RNA folds spatially, forming GR2866 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2866 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2866 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38908] GR2866 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1355 precursor RNA and GAM1356 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to

## GAM PRECURSOR RNA of Fig. 8.

[38909] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1355 RNA and GAM1356 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38910] GAM1355 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1355 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1355 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1355 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38911] GAM1356 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1356 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1356 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1356 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38912] It is appreciated that specific functions, and accordingly utilities, of GR2866 gene, herein designated GR GENE, correlate with, and may be deduced

from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2866 gene: GAM1355 target protein and GAM1356 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1355 and GAM1356

[38913] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2867 (GR2867) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38914] GR2867 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2867 gene was detected is described hereinabove with reference to Figs. 6-15.

[38915] GR2867 gene encodes GR2867 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38916] GR2867 precursor RNA folds spatially, forming GR2867 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2867 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the

nucleotide sequence of GR2867 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [38917] GR2867 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1357 precursor RNA and GAM1358 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38918] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1357 RNA and GAM1358 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38919] GAM1357 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1357 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1357 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1357 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38920] GAM1358 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1358 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1358 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1358 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38921] It is appreciated that specific functions, and accordingly utilities, of GR2867 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2867 gene: GAM1357 target protein and GAM1358 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1357 and GAM1358

[38922] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2868 (GR2868) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38923] GR2868 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which

GR2868 gene was detected is described hereinabove with reference to Figs. 6-15.

[38924] GR2868 gene encodes GR2868 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38925] GR2868 precursor RNA folds spatially, forming GR2868 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2868 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2868 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38926] GR2868 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1361 precursor RNA and GAM1362 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38927] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1361 RNA and GAM1362 RNA respectively, herein

schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38928] GAM1361 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1361 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1361 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1361 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38929] GAM1362 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1362 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1362 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1362 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38930] It is appreciated that specific functions, and accordingly utilities, of GR2868 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2868 gene: GAM1361 target protein and GAM1362 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The

function of these target genes is elaborated hereinabove with reference to GAM1361 and GAM1362

- [38931] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2869 (GR2869) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38932] GR2869 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2869 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38933] GR2869 gene encodes GR2869 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38934] GR2869 precursor RNA folds spatially, forming GR2869 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2869 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2869 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [38935] GR2869 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1364 precursor RNA and GAM1365 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38936] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1364 RNA and GAM1365 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [38937] GAM1364 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1364 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1364 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1364 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [38938] GAM1365 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1365 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1365 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1365 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38939] It is appreciated that specific functions, and accordingly utilities, of GR2869 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2869 gene: GAM1364 target protein and GAM1365 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1364 and GAM1365

[38940] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2870 (GR2870) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38941] GR2870 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2870 gene was detected is described hereinabove with reference to Figs. 6-15.

[38942] GR2870 gene encodes GR2870 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides

long.

[38943] GR2870 precursor RNA folds spatially, forming GR2870 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2870 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2870 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38944] GR2870 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1368 precursor RNA and GAM1369 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38945] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1368 RNA and GAM1369 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38946] GAM1368 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of

GAM1368 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1368 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1368 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38947] GAM1369 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1369 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1369 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1369 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38948] It is appreciated that specific functions, and accordingly utilities, of GR2870 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2870 gene: GAM1368 target protein and GAM1369 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1368 and GAM1369

[38949] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record

2871(GR2871) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38950] GR2871 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2871 gene was detected is described hereinabove with reference to Figs. 6-15.

[38951] GR2871 gene encodes GR2871 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38952] GR2871 precursor RNA folds spatially, forming GR2871 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2871 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2871 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38953] GR2871 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1389 precursor RNA and GAM1390 precursor RNA, herein schematically represented by GAM1

PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38954] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1389 RNA and GAM1390 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38955] GAM1389 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1389 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1389 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1389 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38956] GAM1390 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1390 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1390 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1390 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38957] It is appreciated that specific functions, and accordingly utilities, of GR2871 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2871 gene: GAM1389 target protein and GAM1390 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1389 and GAM1390

[38958] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2872 (GR2872) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38959] GR2872 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2872 gene was detected is described hereinabove with reference to Figs. 6-15.

[38960] GR2872 gene encodes GR2872 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38961] GR2872 precursor RNA folds spatially, forming GR2872 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2872 folded precursor RNA, herein designated GR FOLDED

PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2872 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38962] GR2872 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1396 precursor RNA and GAM1397 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38963] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1396 RNA and GAM1397 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38964] GAM1396 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1396 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1396 target RNA, herein schematically

represented by GAM1 TARGET RNA into GAM1396 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38965] GAM1397 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1397 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1397 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1397 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38966] It is appreciated that specific functions, and accordingly utilities, of GR2872 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2872 gene: GAM1396 target protein and GAM1397 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1396 and GAM1397

[38967] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2873 (GR2873) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

- [38968] GR2873 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2873 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38969] GR2873 gene encodes GR2873 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38970] GR2873 precursor RNA folds spatially, forming GR2873 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2873 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2873 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38971] GR2873 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1421 precursor RNA and GAM1422 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [38972] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX

of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1421 RNA and GAM1422 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38973] GAM1421 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1421 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1421 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1421 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38974] GAM1422 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1422 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1422 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1422 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38975] It is appreciated that specific functions, and accordingly utilities, of GR2873 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2873 gene: GAM1421 target

protein and GAM1422 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1421 and GAM1422

[38976] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2874 (GR2874) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38977] GR2874 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2874 gene was detected is described hereinabove with reference to Figs. 6-15.

[38978] GR2874 gene encodes GR2874 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38979] GR2874 precursor RNA folds spatially, forming GR2874 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2874 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2874 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38980] GR2874 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1427 precursor RNA, GAM1428 precursor RNA and GAM1429 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38981] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1427 RNA, GAM1428 RNA and GAM1429 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38982] GAM1427 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1427 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1427 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1427 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

- [38983] GAM1428 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1428 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1428 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1428 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.
- [38984] GAM1429 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1429 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1429 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1429 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.
- [38985] It is appreciated that specific functions, and accordingly utilities, of GR2874 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2874 gene: GAM1427 target protein, GAM1428 target protein and GAM1429 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1427, GAM1428 and GAM1429

- [38986] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2875(GR2875) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [38987] GR2875 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2875 gene was detected is described hereinabove with reference to Figs. 6-15.
- [38988] GR2875 gene encodes GR2875 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [38989] GR2875 precursor RNA folds spatially, forming GR2875 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2875 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2875 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [38990] GR2875 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM1433 precursor RNA and GAM1434 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[38991] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1433 RNA and GAM1434 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[38992] GAM1433 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1433 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1433 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1433 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[38993] GAM1434 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1434 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1434 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1434 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[38994] It is appreciated that specific functions, and accordingly utilities, of GR2875 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2875 gene: GAM1433 target protein and GAM1434 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1433 and GAM1434

[38995] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2876 (GR2876) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[38996] GR2876 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2876 gene was detected is described hereinabove with reference to Figs. 6-15.

[38997] GR2876 gene encodes GR2876 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[38998] GR2876 precursor RNA folds spatially, forming GR2876 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2876 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2876 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[38999] GR2876 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1435 precursor RNA and GAM1436 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39000] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1435 RNA and GAM1436 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39001] GAM1435 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1435 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1435 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1435 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39002] GAM1436 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1436 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1436 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1436 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39003] It is appreciated that specific functions, and accordingly utilities, of GR2876 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2876 gene: GAM1435 target protein and GAM1436 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1435 and GAM1436

[39004] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2877(GR2877) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39005] GR2877 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2877 gene was detected is described hereinabove with reference to Figs. 6-15.

[39006] GR2877 gene encodes GR2877 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39007] GR2877 precursor RNA folds spatially, forming GR2877 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2877 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2877 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39008] GR2877 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1440 precursor RNA and GAM1441 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39009] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1440 RNA and GAM1441 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39010] GAM1440 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1440 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1440 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1440 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39011] GAM1441 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1441 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1441 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1441 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39012] It is appreciated that specific functions, and accordingly utilities, of GR2877

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2877 gene: GAM1440 target protein and GAM1441 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1440 and GAM1441

[39013] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2878 (GR2878) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39014] GR2878 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2878 gene was detected is described hereinabove with reference to Figs. 6-15.

[39015] GR2878 gene encodes GR2878 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39016] GR2878 precursor RNA folds spatially, forming GR2878 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2878 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2878 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39017] GR2878 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1445 precursor RNA, GAM1446 precursor RNA and GAM1447 precursor RNA, herein schematically represented by GAM1 PRECURSOR, GAM2 PRECURSOR and GAM3 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39018] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1445 RNA, GAM1446 RNA and GAM1447 RNA respectively, herein schematically represented by GAM1 RNA, GAM2 RNA and GAM3 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39019] GAM1445 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1445 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby

inhibiting translation of GAM1445 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1445 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39020] GAM1446 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1446 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1446 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1446 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39021] GAM1447 RNA, herein schematically represented by GAM3 binds complementarily to a target binding site located in an untranslated region of GAM1447 target RNA, herein schematically represented by GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1447 target RNA, herein schematically represented by GAM3 TARGET RNA into GAM1447 target protein, herein schematically represented by GAM3 TARGET PROTEIN, both of Fig. 8.

[39022] It is appreciated that specific functions, and accordingly utilities, of GR2878 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2878 gene: GAM1445 target protein, GAM1446 target protein and GAM1447 target protein, herein

schematically represented by GAM1 TARGET PROTEIN through GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1445, GAM1446 and GAM1447

- [39023] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2879(GR2879) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39024] GR2879 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2879 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39025] GR2879 gene encodes GR2879 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39026] GR2879 precursor RNA folds spatially, forming GR2879 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2879 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2879 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence

which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

- [39027] GR2879 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1457 precursor RNA and GAM1458 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.
- [39028] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1457 RNA and GAM1458 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
- [39029] GAM1457 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1457 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1457 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1457 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.
- [39030] GAM1458 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of

GAM1458 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1458 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1458 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39031] It is appreciated that specific functions, and accordingly utilities, of GR2879 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2879 gene: GAM1457 target protein and GAM1458 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1457 and GAM1458

[39032] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2880 (GR2880) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39033] GR2880 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2880 gene was detected is described hereinabove with reference to Figs. 6-15.

[39034] GR2880 gene encodes GR2880 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39035] GR2880 precursor RNA folds spatially, forming GR2880 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2880 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2880 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39036] GR2880 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1472 precursor RNA and GAM1473 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39037] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1472 RNA and GAM1473 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39038] GAM1472 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1472 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1472 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1472 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39039] GAM1473 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1473 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1473 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1473 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39040] It is appreciated that specific functions, and accordingly utilities, of GR2880 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2880 gene: GAM1472 target protein and GAM1473 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1472 and GAM1473

- [39041] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2881 (GR2881) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.
- [39042] GR2881 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2881 gene was detected is described hereinabove with reference to Figs. 6-15.
- [39043] GR2881 gene encodes GR2881 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.
- [39044] GR2881 precursor RNA folds spatially, forming GR2881 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2881 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2881 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.
- [39045] GR2881 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into

at least 2 separate GAM precursor RNAs, GAM1483 precursor RNA and GAM1484 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39046] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1483 RNA and GAM1484 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39047] GAM1483 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1483 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1483 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1483 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39048] GAM1484 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1484 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1484 target RNA, herein schematically

represented by GAM2 TARGET RNA into GAM1484 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39049] It is appreciated that specific functions, and accordingly utilities, of GR2881 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2881 gene: GAM1483 target protein and GAM1484 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1483 and GAM1484

[39050] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2882 (GR2882) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39051] GR2882 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2882 gene was detected is described hereinabove with reference to Figs. 6-15.

[39052] GR2882 gene encodes GR2882 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39053] GR2882 precursor RNA folds spatially, forming GR2882 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2882 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2882 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39054] GR2882 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1488 precursor RNA and GAM1489 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39055] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1488 RNA and GAM1489 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39056] GAM1488 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1488 target RNA, herein schematically represented by GAM1 TARGET

RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1488 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1488 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39057] GAM1489 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1489 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1489 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1489 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39058] It is appreciated that specific functions, and accordingly utilities, of GR2882 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2882 gene: GAM1488 target protein and GAM1489 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1488 and GAM1489

[39059] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2883(GR2883) gene, which encodes an operon-like cluster of novel micro

RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39060] GR2883 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2883 gene was detected is described hereinabove with reference to Figs. 6-15.

[39061] GR2883 gene encodes GR2883 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39062] GR2883 precursor RNA folds spatially, forming GR2883 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2883 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2883 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39063] GR2883 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1490 precursor RNA and GAM1491 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM

precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39064] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1490 RNA and GAM1491 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39065] GAM1490 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1490 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1490 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1490 target protein, herein schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39066] GAM1491 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1491 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1491 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1491 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39067] It is appreciated that specific functions, and accordingly utilities, of GR2883

gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2883 gene: GAM1490 target protein and GAM1491 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1490 and GAM1491

[39068] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2884 (GR2884) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39069] GR2884 gene, herein designated GR GENE, is a novel bioinformatically detected regulatory, non protein coding, RNA gene. The method by which GR2884 gene was detected is described hereinabove with reference to Figs. 6-15.

[39070] GR2884 gene encodes GR2884 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39071] GR2884 precursor RNA folds spatially, forming GR2884 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2884 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as

hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2884 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39072] GR2884 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1492 precursor RNA and GAM1493 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39073] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1492 RNA and GAM1493 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

[39074] GAM1492 RNA, herein schematically represented by GAM1 binds complementarily to a target binding site located in an untranslated region of GAM1492 target RNA, herein schematically represented by GAM1 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1492 target RNA, herein schematically represented by GAM1 TARGET RNA into GAM1492 target protein, herein

schematically represented by GAM1 TARGET PROTEIN, both of Fig. 8.

[39075] GAM1493 RNA, herein schematically represented by GAM2 binds complementarily to a target binding site located in an untranslated region of GAM1493 target RNA, herein schematically represented by GAM2 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1493 target RNA, herein schematically represented by GAM2 TARGET RNA into GAM1493 target protein, herein schematically represented by GAM2 TARGET PROTEIN, both of Fig. 8.

[39076] It is appreciated that specific functions, and accordingly utilities, of GR2884 gene, herein designated GR GENE, correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the operon-like cluster of GR2884 gene: GAM1492 target protein and GAM1493 target protein, herein schematically represented by GAM1 TARGET PROTEIN and GAM TARGET PROTEIN respectively. The function of these target genes is elaborated hereinabove with reference to GAM1492 and GAM1493

[39077] Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory gene, referred to here as Genomic Record 2885 (GR2885) gene, which encodes an operon-like cluster of novel micro RNA-like genes, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

[39078] GR2885 gene, herein designated GR GENE, is a novel bioinformatically

detected regulatory, non protein coding, RNA gene. The method by which GR2885 gene was detected is described hereinabove with reference to Figs. 6-15.

[39079] GR2885 gene encodes GR2885 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred nucleotides long.

[39080] GR2885 precursor RNA folds spatially, forming GR2885 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR2885 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, comprises a plurality of what is known in the art as hairpin structures. These hairpin structures are due to the fact that the nucleotide sequence of GR2885 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, as is well known in the art.

[39081] GR2885 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1495 precursor RNA and GAM1496 precursor RNA, herein schematically represented by GAM1 PRECURSOR and GAM2 PRECURSOR respectively, each of which GAM precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM PRECURSOR RNA of Fig. 8.

[39082] The above mentioned GAM precursor RNAs are diced by DICER COMPLEX of Fig. 8, yielding respective short RNA segments of about 22 nucleotides in

length, GAM1495 RNA and GAM1496 RNA respectively, herein schematically represented by GAM1 RNA and GAM2 RNA respectively, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.
